

Tehama System Installation Guide

General Description

The Tehama AMR system consists of three device types to remotely monitor various environmental and utility readings and provide the data to a central database or PC for formal presentation and reporting. MDT/Sensor devices will be placed in all locations requiring local monitoring of data. The MDT/Sensors will transmit time stamped data to the DCAP device, which receives the data and stores it in a Database. The database information is available over Ethernet on the local LAN or the Internet. For MDT/Sensors that are out of range from the DCAP, Repeater devices are added in appropriate locations to relay the data between MDT/Sensors and the DCAP.

The system operates in the 915Mhz ISM bands using off-the-shelf FSK RFIC radios. The system operates as a Frequency Hopper over 60 narrow band frequency channels, incorporating a bidirectional communication link with Acknowledge (ACK) messages to ensure all data reaches the DCAP. The MDT/Sensors are battery operated, bursting data packets at pre-programmed times then shutting down to conserve battery life, estimated to exceed 5 years. The DCAP and Repeater units are line powered.

With an typical MDT/Sensor transmission rate of four per hour for time of use applications, a single DCAP can accommodate many hundreds of MDT/Sensors. Through the use ACK messages and local memory in both the MDT/Sensors and Repeaters, the number of MDT/Sensors supported can exceed a thousand. There is no limit to the number of repeaters, though an average installation may require one Repeater for every 20-30 MDT/Sensors.
