1 DNA: The Genetic Material

BEFORE YOU READ

In 1953, James Watson and Francis Crick discovered the structure of DNA. But they were not the first people to ask, “How is genetic information passed from one generation to the next?” Watson and Crick’s work was possible because of the work of other scientists. On the lines below, identify a task that is possible only because of the work of many people. Then read the lesson to learn more about how scientists discovered that DNA is the genetic code.

The building of super cars is only possible due to people working on them for decades.

Discovery of the Genetic Material

Mendel’s laws of inheritance became well known to scientists in the early 1900s. Scientists knew that genes were carried on chromosomes. They also knew that chromosomes were made of DNA and protein. For many years, scientists tried to determine which of these two molecules—DNA or protein—carried the genetic information of a cell.

What was Griffith’s experiment?

In 1928, Frederick Griffith conducted an experiment that led to the discovery of DNA as the genetic material. Griffith studied two strains of *Streptococcus pneumoniae*. One strain had a sugar coat and caused pneumonia. It was called smooth (S) because colonies of bacteria appear smooth. Another strain did not have a sugar coat and did not cause pneumonia. It was called rough (R) because its colonies have rough edges. Follow along with Griffith’s study described on the next page.

WHAT YOU’LL LEARN

- the basic structure of DNA
- experiments that led to the discovery of DNA as the genetic material

◀ FOCUS

As you read this lesson, underline the name of each scientist introduced. Highlight the sentences that explain each person’s contribution to understanding DNA.

THINK IT OVER

1. **Contrast** Name two ways that rough bacteria differ from smooth bacteria.

The R strain is non-pathogenic (does not cause disease). The S strain is pathogenic (disease-causing), and has
