Catalog of Copyright Entries. Third Series Library of Congress. Copyright Office, 1976 Essentials of Brownian Motion and Diffusion Frank B. Knight, 1981 This work was first drafted five years ago at the invitation of the editors of the Encyclopedia of Mathematics and its Applications However it was found to contain insufficient physical applications for that series hence it has finally come to rest at the doorstep of the American Mathematical Society The first half of the work is little changed from the original a fact which may partly explain both the allusions to applications and the elementary approach It was written to be understood by a reader having minimal familiarity with continuous time stochastic processes The most advanced prerequisite is an understanding of discrete parameter martingale convergence theorem This book contains a general summary and outline and an introduction It presents some gratuitous generalities on scientific method as it relates to diffusion theory Brownian motion is defined by the characterization of P Levy Then it is constructed in three basic ways and these are proved to be equivalent in the appropriate sense Uniqueness theorem Projective invariance and the Brownian bridge is presented Probabilistic and absolute properties are distinguished Among the former includes the distribution of the maximum first passage time distributions and fitting probabilities and among the latter includes law of created logarithm quadratic variation Holder continuity non recurrence for $r \geq 2$ 3 General methods of Markov processes are adapted to diffusion Analytic and probabilistic methods are distinguished Among the former include transition functions semigroups generators resolvents Among the latter include Markov properties stopping times zero or one laws Dynkin s formula additive functionals The book features classical modifications of Brownian motion absorption and the dirichlet problem space time process and the heat equation killed processes Green functions and the distributions of additive sectionals and time change theorem classical case parabolic equations and their solution semigroups some basic examples

distribution of passage times The book covers Local time construction by random walk embedding Local time processes Trotter's theorem The Brownian flow Brownian excursions The zero set and Levy's equivalence theorem Local times of classical diffusions and Sample path properties It also includes boundary conditions for Brownian motion the general boundary conditions construction of the processes using local time and green functions and eigenfunction expansions compact case Another chapter is a finale on nonsingular diffusion The generators d/dx are characterized The diffusions on open intervals are constructed The conservative boundary conditions are obtained and their diffusions are constructed The general additive functionals and nonconservative diffusions are developed and expressed in terms of Brownian motions The audience for this survey includes anyone who desires an introduction to Markov processes with continuous paths that is both coherent and elementary The approach is from the particular to the general Each method is first explained in the simplest case and supported by examples Therefore the book should be readily understandable to anyone with a first course in measure theoretic probability
