*Soil Pollution* Bruno Yaron, Raoul Calvet, Rene Prost, 2012-12-06 The soil is the medium through which pollutants originating from human activities both in agriculture and industry move from the land surfaces to groundwater Polluting substances are subject to complex physical chemical and biological transformations during their movement through the soil Their displacement depends on the transport properties of the water air soil system and on the molecular properties of the pollutants Prediction of soil pollution and restoration of polluted soils requires an understanding of the processes controlling the fate of pollutants in the soil medium and of the dynamics of the contaminants in the unsaturated zone Our book was conceived as a basic overview of the processes governing the behavior of pollutants as affected by soil constituents and environmental factors It was written for the use of specialists working on soil and unsaturated zone pollution and restoration as well as for graduate students starting research in this field Since many specialists working on soil restoration lack a background in soil science or a knowledge of the properties of soil pollutants we have included this information which forms the first part of the book In the second part we discuss the partitioning of pollutants between the aqueous solid and gaseous phase of the soil medium The retention transformation and transport of pollutants in the soils form the third section
