Inman,Steven Jackson,Brian H. Philips,2016 This study set out to examine the following diverse questions regarding cooperative adaptive cruise control CACC use Does CACC reduce driver workload relative to manual gap control Does CACC increase the probability of driver distraction relative to manual gap control Does CACC result in reduced driver arousal relative to manual gap control Does CACC result increase the ability to avoid a crash when exposed to an extreme breaking event Will drivers trust the CACC system These questions were addressed in an experiment conducted in the Federal Highway Administration Highway Driving Simulator A total of 49 licensed drivers were tested with 12 or 13 participants in each of 4 groups All of the groups drove in the third position in a five vehicle platoon in which all of the other

vehicles were equipped with simulated CACC. The groups differed as to whether the participant vehicle was equipped with CACC and the type of event at the end of the drive that disturbed the longitudinal spacing of the platoon. As assessed by the National Aeronautics and Space Administration Task Load Index, the CACC system did reduce perceived driver workload relative to driving without cruise control. CACC users appeared slightly more likely to engage in diversionary activities, e.g. listening to the car radio, than control group drivers. CACC yielded a substantial and statistically reliable reduction in the probability of a crash. No evidence was obtained to suggest that use of CACC leads to lower levels of driver arousal than manual gap control. Participants showed a great deal of trust in the CACC system. In a situation where all of the control participants used the brake to maintain a comfortable gap, only 2 of 36 CACC users overrode the system with the brake or accelerator.

**Summary Report** Vaughan W. Inman, Stacy A. Balk, Steven Jackson, Brian H.

Philips, 2017. This summary report provides a high level overview of four experiments that investigated human factors issues surrounding cooperative adaptive cruise control (CACC). CACC combines three driver assist systems: 1. conventional cruise control which automatically maintains the speed a driver has set; 2. adaptive cruise control which uses radar or light detection and ranging sensors to automatically maintain a gap the driver has selected between the driver's vehicle and a slower moving vehicle ahead; and 3. dedicated short range communications to transmit and receive data with surrounding vehicles so that the cruise control system can more quickly respond to changes in speed and location of other CACC vehicles, even vehicles that the driver cannot see. This report describes a series of experiments that examined how use of a CACC affected drivers' workload, propensity to distraction, level of physiological arousal, ability to avoid a crash, merging abilities, and trust in the system. The first experiment compared driving with CACC in a string of four or five vehicles with manual control of the following distance in the same strings. The second experiment explored driver performance when merging into a string of CACC vehicles. The third experiment took a closer look at the source of a substantial crash reduction benefit obtained with CACC in the first experiment. The fourth experiment examined the effect of a driver's preferred following distance on performance and workload when using short and long CACC gap settings.
