

4 Finite Element Data Structures in Matlab

Here we discuss the data structures used in the finite element method and specifically those that are implemented in the example code. These are somewhat arbitrary in that one can imagine numerous ways to store the data for a finite element program, but we attempt to use structures that are the most flexible and conducive to Matlab. The design of these data structures may be depend on the programming language used, but usually are not significantly different than those outlined here.

4.1 Nodal Coordinate Matrix

Since we are programming the finite element method it is not unexpected that we need some way of representing the element discretization of the domain. To do so we define a set of nodes and a set of elements that connect these nodes in some way. The node coordinates are stored in the nodal coordinate matrix. This is simply a matrix of the nodal coordinates (imagine that). The dimension of this matrix is $n \times s$ where n is the number of nodes and s is the number of spatial dimensions of the problem. So, if we consider a nodal coordinate matrix `nodes` the y -coordinate of the n^{th} node is `nodes(n,2)`. Figure 1 shows a simple finite element discretization. For this simple mesh the nodal coordinate matrix would be as follows:

$$\text{nodes} = \begin{bmatrix} 0.0 & 0.0 \\ 2.0 & 0.0 \\ 0.0 & 3.0 \\ 2.0 & 3.0 \\ 0.0 & 6.0 \\ 2.0 & 6.0 \end{bmatrix}. \quad (1)$$

4.2 Element Connectivity Matrix

The element definitions are stored in the element connectivity matrix. This is a matrix of node numbers where each row of the matrix contains the connectivity of an element. So if we consider the connectivity matrix `elements` that describes a mesh of 4-node quadrilaterals the 36th element is defined by the connectivity vector `elements(36,:)` which for example may be [36 42 13 14] or that the elements connects nodes $36 \rightarrow 42 \rightarrow 13 \rightarrow 14$. So for
