【Wiring Diagram】

Note: There are 2 control wires on the HV controller. The longer one is close to the positive battery wire, which is connected with the receiver, and the shorter one is close to the negative battery wire, which can be connected with the program card to set the programmable parameters of the controller.

【Feature Explanation】

1. **Brake:** Brake Enabled / Brake Disabled, default is Brake Disabled.
2. **Battery Type:** LI-xx(Li-Ion or Li-po) / Ni-xx(NiMH or NiCd), default is LI-xx.
3. **Low Voltage Protection Mode(Cutoff Mode):** Soft Cutoff (Gradually reduces the output power) or Hard Cutoff (Immediately stops the output power), default is Soft Cutoff.
4. **Low Voltage Protection Threshold(Cutoff Threshold):** Low / Medium / High, default is Medium.
 - For LI-xx battery, the number of battery cells are calculated automatically. low / medium / high cutoff voltage for each cell are: 2.6V/2.85V/3.1V. For example: 10 cells Lipo, when medium cutoff voltage is set, the cutoff voltage is: $2.85 \times 10 = 28.5V$.
 - For Ni-xx battery, low / medium / high cutoff voltages are 0%/45%/60% of the startup voltage (i.e. the initial voltage of battery pack). 0% means the low voltage protection function is disabled. For example: 20 cells NiMH battery, fully charged voltage is $1.44 \times 20 = 28.8V$, when "Medium" value is set, the cutoff voltage is: $28.8 \times 45\% = 12.96V$.
5. **Start Mode:** Normal / Soft / Super-soft, default is Normal startup. Normal is suitable for fixed-wing aircraft. Soft and Super-soft are suitable for helicopters. The initial speed of Soft and Super-soft mode is very slow, it will take 3 seconds (Soft startup) or 6 seconds (Super-soft startup) from startup to full speed. But if the motor is running, then the throttle is closed (throttle stick is moved to bottom) and opened again (throttle stick is moved upwards) within 3 seconds, the restart will be temporarily changed to normal mode to get rid of the chances of crash caused by slow throttle response in aerobatic fly.
6. **Timing:** Low / Medium / High, default is Low. In normal cases, Low or Medium timing can be suitable for most motors. In order to get higher speed, try the High timing value.

Note: After you changing the timing setting, please test your RC model on ground firstly!

【Begin To Use The New ESC】

Before using your new ESC, please check all the connections to make sure that they are reliable, and then start up the ESC in the following sequence:

1. Move the throttle stick to bottom, and then switch on the transmitter.
2. Connect the receiver battery pack (4-6V) to the receiver, and then connect the main power battery pack to ESC, the ESC begins the self-test process, and the motor will emit several "beep" tones to represent the number of lithium battery cells. After 2 seconds a long "beep——" tone will be emitted, which means the self-test is OK, and now the RC model is ready to go flying.
 - If nothing is happened, please check your battery packs and all the connections;
 - If a special tone "2*4*12" is emitted after 2 beep tones (beep-beep-), means the ESC has entered the program mode, i.e. the throttle channel of your transmitter is reversed, please set it correctly on the transmitter;
 - If a very rapid "beep-beep-, beep-beep-" tone is emitted (The time interval of each "beep-beep-" tone is 1 second), means the input voltage is too low or too high, please check your battery's voltage.
