### Answers to Questions

- Q7-1.** The transport layer communication is between two ports; the network layer communication is between two hosts. This means that each layer has a different source/destination address pair; each layer needs a different header to accommodate these pair of addresses. In addition, there are other pieces of information that need to be separately added to the corresponding header.
- Q7-2.** Routing cannot be done at the transport layer, because the communication at the transport layer is one single logical path between the source port and the destination port. Routing cannot be done at the data-link layer because the communication at the data-link layer is between two nodes (one single path); there is no need for routing. On the other hand, there are several possible paths for a packet between the source host and destination host at the network layer. Routing is the job of selecting one of these paths for the packet.
- Q7-3.** Forwarding is delivery to the next node. A router uses its forwarding table to send a packet out of one of its interfaces and to make it to reach to the next node. In other words, forwarding is the decision a router makes to send a packet out of one of its interfaces. Routing, on the other hand, is an end-to-end delivery resulting in a path from the source to the destination for each packet. This means a routing process is a series of forwarding processes. To enable each router to perform its forwarding duty, routing protocols need to be running all of the time to provide updated information for forwarding tables. Although forwarding is something we can see in the foreground, in the background, routing provides help to the routers to do forwarding.
- Q7-4.**
- a. In the datagram approach, the forwarding decision is made based on the destination address in the packet header.
  - b. In the virtual-circuit approach, the forwarding decision is based on the label in the packet header.
- Q7-5.** The number of virtual circuits is  $2^8 = 256$ .
- Q7-6.** The three phases are setup phase, data transfer, and teardown phase.
