Leica M2 Military Camera Repair Manual Signal Corps U. S. Army Staff,2000-05-01 **Digital Airborne Camera**
Rainer Sandau,2009-12-10 Digital airborne cameras are now penetrating the fields of photogrammetry and remote sensing
Due to the last decade s results in research and development in the fields of for instance detector technology computing
power memory capacity position and orientation measurement it is now possible to generate with this new generation of
airborne cameras different sets of geometric and spectral data with high geometric and radiometric resolutions within a
single flight This is a decisive advantage as compared to film based airborne cameras The linear characteristic of the opto
electronic converters is the basis for the transition from an imaging camera to an images generating measuring instrument
Because of the direct digital processing chain from the airborne camera to the data products there is no need for the
processes of chemical film development and digitising the film information Failure sources as well as investments and staff
costs are avoided But the effective use of this new technology requires the knowledge of the features of the image and
information generation its possibilities and its restrictions This book describes all components of a digital airborne camera
from the object to be imaged to the mass memory device So the image quality influencing processes in nature are described
as for instance the reflection of the electromagnetic sun spectrum at the objects to be imaged and the influence of the
atmosphere Also the essential features of the new digital sensor system their characteristics and parameters are addressed
and put into the system context The complexity of the cooperation of all camera components as for instance optics filters
detector elements analogue and digital electronics software and so forth becomes transparent The book includes also the
