

Neutral Operation

The HFD is a closed loop system. The charge pump, located on the back of the HFD pump, supplies makeup oil to the closed loop and charge pressure after the pump displacement control valve. The charge pump isolates oil from the transmission pump.

Since the oil is in motion, no leakage is present at the electrical displacement control valve seals.

Since the displacement control valve will always be in neutral position and not direct charge pressure to the return cylinders.

The oil around the servo cylinders is kept in motion. Springs in the servo cylinders will maintain the servos in the HFD pump in the neutral position. With the servos in neutral, both sides of the closed loop are charged with 1000 PSI (69 bar) and 275 psi (19 bar) charge oil at all times. Fluid pressures at the HFD and center of the motor will never be lower than 1000 PSI.
