Richard Kim,1999 When FWD tests are performed on broken or cracked pavements of which information is crucial in making rehabilitation and overlay decisions the multi layered elastic theory based backcalculation programs assume that the effect of

these discontinuities in a cracked layer on deflection basins would be accounted for by the reduction of the elastic modulus for that layer. However, it has been concluded and confirmed by researchers and practitioners that the backcalculation algorithms based on the multi-layered elastic theory produce large variation in the algorithms based on the multi-layered elastic theory produce large variation in the effective moduli of the cracked layers. Studies have also shown that significant errors in the backcalculated pavement moduli can accrue from performing a static analysis of what is inherently a dynamic test. Unfortunately, dynamic analysis usually involves complex calculations and requires significant computation time, thus making it impracticable for routine applications. This study presents a methodology based on deflection basin parameters.

 Paperback. These proceedings contain the papers presented at the 3rd IFAC CIGR Workshop on AI in Agriculture held at Chiba in Japan during April 1998. Four major global issues, namely a shortage of food, a shortage of fuel energy, natural resources, environmental pollution, and instability of various ecosystems, will become increasingly critical in the early 21st century when the world population is predicted to reach nearly 10 billion. It is hoped that the papers included in these proceedings will contribute to solving the above global issues, improving the quality of research, and widening the application fields of artificial intelligence in agriculture. *Proceedings of the ...
