Chapter 7: DNA Structure and Replication

Biologically Unique: How DNA helped free an innocent man

Driving Question 1:

What is the function of DNA, and how is DNA organized in cells?

Why should you care?

DNA is the hereditary molecule—passed from parents to offspring—that serves as the instruction manual for “building” each individual. DNA is found in the nucleus of almost every cell in our body. Forensic scientists can, therefore, collect DNA evidence from many different types of crime scene evidence, such as semen, saliva, skin cells, blood, and hair. This DNA can then be used to positively identify a perpetrator or exonerate accused suspects of a crime.

Roy Brown was convicted by junk science; the only “evidence” linking him to the crime was his teeth, and bite mark analysis is notoriously unreliable. Other types of physical evidence, such as hair samples examined under a microscope, are also problematic because they are not distinct enough to positively identify the individual from which they come. DNA is valuable in forensics because it is unique to each individual. DNA’s structure is the key to its uniqueness in each individual.

What should you know?

To fully answer this Driving Question, you should be able to:

1. Describe the origin and function of DNA.
2. Describe the location of DNA in eukaryotic cells.
3. Describe the structure of chromosomes.
4. Describe the number and origin of the chromosomes in human cells.

Infographic Focus:

The infographics most pertinent to the Driving Question are 7.1 and 7.2.

Test Your Vocabulary:

Match these terms to their definitions:

[DEOXYRIBONUCLEIC ACID (DNA)] The molecule of heredity, common to all life forms, that is passed from parents to offspring.

[CHROMOSOME] A single, large DNA molecule wrapped around proteins.

Chromosomes are located in the nuclei of most eukaryotic cells.

[NUCLEOTIDES] The building blocks of DNA. Each nucleotide consists of a sugar, a phosphate, and a base. The sequence of nucleotides (As, Cs, Gs, Ts) along a DNA strand is unique to each person.

1. Describe the origin and function of DNA.

Life at High Pressure Alister Macdonald, 2021-07-12 The book discusses the ways in which high hydrostatic pressure i.e. water pressure affects all grades of life which thrive at pressures much greater than those in our normal environment The deep sea is the best known high pressure environment where pressures reach a thousand times greater than those at the surface yet it is populated by a variety of animals and microorganisms The earth's crust supports microorganisms which live in water filled pores at high pressure In addition the load bearing joints of animals like ourselves experience pulses of hydrostatic pressure of a magnitude similar to the pressure at mid ocean depths These pressures affect molecular structures and biochemical reactions Basic cellular processes are drastically affected the growth and division of cells the way nerves conduct impulses and the chemical reactions which provide energy Adaptation to high pressure also occurs in complex physiological systems such as those which provide buoyancy Probably the greatest challenge to our understanding of adaptation to high pressure is the stabilisation of the nervous system of deep sea animals to avoid convulsions which pressure causes in shallow water animals Additionally the book provides insight into the engineering required to study life at high pressure equipment which can trap small deep sea animals and retrieve them at their high pressure equivalent equipment for microorganisms laboratory microscopes which can focus on living cells under high pressure incubators for bacteria which require high pressure to grow high pressure aquaria for marine animals and lastly and briefly manned and unmanned submersible vessels Landers and deep drill hole sampling Rather like the organisms studied many laboratory instruments have been adapted to
