

EXPERIMENT NO. 1

OBJECT :- Study the lathe machine, lathe tools cutting speed, feed and depth of cut.

INTRODUCTION

- A lathe is a large machine that rotates the work, and cutting is done with a non-rotating cutting tool. The shapes cut are generally round, or helical. The tool is typically moved parallel to the axis of rotation during cutting.
- Manual lathes have the following major components,
 - General classifications used when describing lathes are,
 1. - Swing - the largest diameter of work that can be rotated.
 2. - Distance Between Centres - the longest length of workpiece
 3. - Length of Bed - Related to the Distance Between Centres
 4. - Power - The range of speeds and feeds, and the horsepower available
- The critical parameters on the lathe are speed of rotation (speed in RPM) and how far the tool moves across the work for each rotation (feed in IPR).

head stock - this end of the lathe contains the driving motor and gears. Power to rotate the part is delivered from here. This typically has levers that let the speeds and feeds be set.

ways - these are hardened rails that the carriage rides on.

tail stock - this can be used to hold the other end of the part.

bed - this is a bottom pan on the lathe that catches chips, cutting fluids, etc.

carriage - this part of the lathe carries the cutting tool and moves based on the rotation of the lead screw or rod.

lead screw - a large screw with a few threads per inch used for cutting threads.

lead rod - a rod with a shaft down the side used for driving normal cutting feeds.
