Steven Frank Barrett, Daniel J. Pack, 2005 For a second microprocessor course for students enrolled in Electrical Computer Engineering Microcontroller courses Designed for a senior or graduate level embedded systems design course Embedded Systems Design and Applications with the 68HC12 introduces readers to unique issues associated with designing testing integrating and implementing microcontroller microprocessor based embedded systems *Ultra-Low Energy*

Domain-Specific Instruction-Set Processors Francky Catthoor, Praveen Raghavan, Andy Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility However achieving this goal is already complex when looking at the processor in isolation but in reality the processor is a single component in a more complex system In order to design such complex system successfully critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi dimensional exploration space In the complex global design of battery operated embedded systems the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy aware architecture exploration of domain specific instruction set processors and the co optimization of the datapath architecture foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design By performing an extensive energy breakdown experiment for a complete embedded platform both energy and performance bottlenecks have been identified

together with the important relations between the different components Based on this knowledge architecture extensions are proposed for all the bottlenecks

Subject Guide to Books in Print, 1993 *Microprocessor Architectures* Henk Corporaal, 1998 Exploring new trends in computer technology Corporaal introduces an innovative and exciting concept Transport Triggered Architecture TTAs Unlike most traditional architectures where programmed operations trigger internal data transports TTAs function through programming the data transports themselves As a result the new architecture alleviates bottlenecks allows for new code generation optimizations and exploits hardware more efficiently Founded on the author's recent research this book evaluates the attributes of different classes of architectures It demonstrates how TTAs can be used as a template for automatic generation of application specific processors and highlights their suitability for embedded system design Several commercial TTA implementations have proven its concepts and advantages Features includes Complexity analysis of the data path of Instruction Level Parallel processors particularly of VLIW Very Long Instruction Word and super pipelined processors Derivation of the transport triggering concept illustrating processor simplification In depth analysis of the architecture design space of TTAs and evaluation of architecture parameters Examination of the control and pipelining of instruction function and register units Description of a trajectory for the automatic synthesis of TTAs for arbitrary applications written in a high level language Detailed description of a prototype TTA processor enabling the reader to design an embedded computer system with excellent cost performance ratio

Microprocessor Architectures is cutting edge text which will prove invaluable to both industrial hardware and software engineers involved in embedded system design and to postgraduate electrical engineering and computer science students This clearly structured reference demonstrates the versatility of TTAs and explores their influential role in the next generation of computer architecture

Introduction to Embedded Systems Manuel Jiménez, Rogelio Palomera, Isidoro Couvertier, 2013-09-11 This textbook serves as an introduction to the subject of embedded systems design using microcontrollers as core components It develops concepts from the ground up covering the development of embedded systems technology architectural and organizational aspects of controllers and systems processor models and peripheral devices Since microprocessor based embedded systems tightly blend hardware and software components in a single application the book also introduces the subjects of data representation formats data operations and programming styles The practical component of the book is tailored around the architecture of a widely used Texas Instrument's microcontroller the MSP430 and a companion web site offers for download an experimenter's kit and lab manual along with Powerpoint slides and solutions for instructors
