There has been an increase in camelid related scientific output in the last few decades covering all aspects from farming to reproduction technologies and from internal medicine to welfare. Camelids are multi purpose animals being kept not only for milk meat and wool production but also for working riding beauty contests and racing. The growing needs and rising awareness about camels have changed the notion of them being just ships of the desert to being recognized as food security animals in many arid and semi arid areas of the world. Camels play a prominent role in pastoral economies globally and are predicted to meet the milk and meat demands of pastoral communities in particular. Consequently camels have been described as the livestock of the future. However New World Camelids namely llamas and alpacas have also gained increasing popularity resulting in a greater demand for veterinary care for llamas and alpacas worldwide. Our current knowledge of camelid behavior physiology health and welfare is still limited and camelid farming practices are often based on traditions and beliefs. Therefore there is a pressing need for more evidence to implement regulations that can protect camelid health and welfare while also enhancing their productivity. We welcome articles addressing but not limited to the following themes: Advances in camelid reproductive technologies, Innovations in camelid health and internal medicine, Current trends in camelid welfare practices, Impact of camelid farming on pastoral economies, Role of camelids in food security and sustainability in arid regions, Comparative studies between Old World and New World camelids. **Experiments and Exercises in Educational Psychology** Harvey Andrew Peterson, 1925 *Abstract Mathematical Cognition* Wolfgang Grodd, Philippe Chassy, 2016-08-09 Despite the importance of mathematics in our educational systems little is known about how abstract mathematical thinking emerges. Under the uniting thread of mathematical development we hope to connect researchers from various backgrounds to provide an integrated view of abstract mathematical cognition. Much progress has been made in the last 20 years on how numeracy is acquired. Experimental psychology has brought to light the fact that numerical cognition stems from spatial cognition. The findings from neuroimaging and single cell recording experiments converge to show that numerical representations take place in the intraparietal sulcus. Further research has demonstrated that supplementary neural networks might be recruited to carry out subtasks for example the retrieval of arithmetic facts is done by the angular gyrus. Now that the neural networks in charge of basic mathematical cognition are identified we can move onto the stage where we seek to understand how these basic skills are used to support the acquisition and use of abstract mathematical concepts. **Reports and Tables of Experiments on Hemp and Wire Rope**, 1871 *Practical*
