

Commer TS3 Engine Operation: Image-1

Compression Cycle

As the pistons commence their compression stroke, the exhaust ports are closed because the exhaust piston has a slight lead over the air piston whilst filtered air continues to enter the cylinder through the air-ports. This design feature causes the air to swirl as it enters the cylinder, which aids complete combustion. In normal operation, the blower increases the pressure of the inlet air chest to about 42 kPa (6-PSI) above atmospheric. Once the inlet ports close, the compression cycle commences.
