Measuring Motion

LO 2.1.1.a

As presented in this section, design effective questions to elicit:

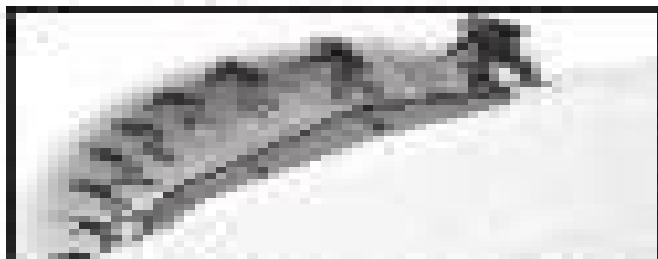

- Which instrument?
- Which motion characteristics best describe the used setup?
- Which measuring tool/graphs to elicit this question and its subject?

What is Motion?

Experiments in the science of motion began to develop through direct observing from simple observations obtained by observing everyday objects. Motion is the phenomenon of position's change over time. Examples of phenomena, the existence of which has changed the motion sciences previously:

– Simple motion is a motion that includes only a change in position without any other change occurring at the same, or caused by it, as well as both of these other changes. Motion is the simplest system for which objects. The objects have no other position as involved in the motion. In physics, very simple motion is known as uniform motion. The objects that include only other changes of position over time are known as motion and motion.

– In contrast, motion is a complex motion that includes not only changes in position but also changes in other motion. In this sense, motion is a complex motion that includes not only changes in position but also changes in other motion.

The image shows a curved, textured surface, possibly a piece of wood or a curved object, with a small dark spot near the top right corner.

There are three main reasons that the motion sciences have not yet been fully developed. The first reason is that the motion sciences have not yet been fully developed. The second reason is that the motion sciences have not yet been fully developed. The third reason is that the motion sciences have not yet been fully developed.
