

because this spectrum belongs to that "missing channel" on your TV or VCR tuner — for many people, 6 meters is TV Channel 1! Since so much ham equipment is manufactured overseas for a global ham/commercial/paramilitary/diplomatic market, 6 meters gets little consideration except for a few costly accessory transverters or expanded-coverage rigs.

6 Meters is FOUR MEGAHERTZ of valuable VHF spectrum with many HF DX characteristics, four MHz available to virtually all U.S. hams as well as hams in an ever-growing number of other countries. The T-KIT 1209 Transverter gives you access to that band very conveniently and affordably.

Circuit Description

The T-KIT 1209 Transverter uses a 94 MHz crystal controlled oscillator, quad diode mixer, PIN diode signal switching and other supporting circuitry to transmit and receive in the 50-54 MHz amateur band using a 2 meter transceiver capable of 5 watts output. Please use the block diagram on page 9 and the following descriptions to build up an understanding of the Model 1209 schematic diagram. The schematic diagram is also reproduced in sections corresponding to the kit assembly phases. Learning the circuit, even if done very gradually, is the key to building, using and maintaining the transverter with full confidence in it and in yourself.

Transmit/Receive Control Voltages: The transverter uses a carrier detect circuit C6, D1 and D2 to monitor the input from the 2 meter transceiver. When the transceiver is keyed the two diodes rectify a small sample of the input signal and develop a control voltage that switches transistors Q1 through Q4. These transistors provide a pair of TRANSMIT and RECEIVE bias voltages that power the other stages in the transverter. This circuit operates automatically and is silent and almost instantaneous.

Input Attenuator: Most 2 meter mobile transceivers will have a low power setting that results in an output of about 5 watts. Handheld transceivers usually will also have an output of about 5 watts. For convenience the model 1209 is set to accept this input level. Resistors R1-R4 provide the necessary 50 ohm load for the transceiver. R5 and R6 are selected to provide a small amount of input signal to the diode mixer stage.
