Freedom is the power to decide what your computer does and the only way to have this freedom is to know what your computer is doing. Freedom is a computer that is without secrets, one where everything can be known if you care enough to find out. Why Use The Command Line? Have you ever noticed in the movies when the super hacker you know the guy who can break into the ultra secure military computer in under thirty seconds sits down at the computer he never touches a mouse? It's because movie makers realize that we as human beings instinctively know the only way to really get anything done on a computer is by typing on a keyboard. Most computer users today are only familiar with the graphical user interface GUI and have been taught by vendors and pundits that the command line interface CLI is a terrifying thing of the past. This is unfortunate because a good command line interface is a marvelously expressive way of communicating with a computer in much the same way the written word is for human beings. It's been said that graphical user interfaces make easy tasks easy while command line interfaces make difficult tasks possible and this is still very true today. Since Linux is modeled after the Unix family of operating systems it shares the same rich heritage of command line tools as Unix. Unix came into prominence during the early 1980s although it was first developed a decade earlier before the widespread adoption of the graphical user interface and as a result developed an extensive command line interface instead. In fact one of the strongest reasons early adopters of Linux chose it over say Windows NT was the powerful command line interface which made the difficult tasks possible.

Linux for Beginners Mark J. Raam, 2021-05-25. Do you want to learn Linux and its fundamentals, improve your computer programming skills, and become computing expertise? If yes, then keep reading. Linux has been well known as one of the most powerful operating systems in the world of cybersecurity and coding. Among its various components, Kali Linux is one of the distributions which can be treated like a boon for ethical hackers and IT people. However, everything comes with several

problems In this world of today people have excessive trust in Kali Linux capabilities by default only As a result most users are not paying attention to the various manual aspects of Linux security It is true that with Linux you can automate many of your tasks However it also requires some manual touch for keeping everything with the pace This fact even becomes more evident when it comes to the concept of security Though an operating system might automate all your tasks it is your task to be anxious always You are required to keep a close eye on the settings of our application and various other details When you have a well configured Kali Linux system it might turn out to be the most difficult thing to crack However most Kali Linux users do not have profound knowledge about what is required for keeping their whole systems locked up If you start using a brand new application try to pay very close attention to its configuration details Running the application with the same example settings and then using it is not the ideal option It is not at all recommended Some of the developers in the past also put decoy settings in the applications to make sure that the applications are prevented from running This was a great way to ensure that all the users have checked out the file of a configuration of the application When it comes to permissions it forms an essential part of Linux It is essential for a user to clearly understand how every permission functions and the implications of the various components of the OS If you are shifting from Windows to Linux the generalized concept might be a bit different and awkward for you The general rule of Kali Linux is that you are not supposed to use root for your daily work This might sound like a bit of a surprise for all the Windows users in which the operating system handles the various permissions which are critical in nature in a different way It is surely an inconvenient function to type a password each time you want the machine to execute a function However it is practical and will surely help prevent some serious security problems with your machine in the future In this book you will learn more about Basic Linux commands Linux Installation File System Basic Shell Programming What to Do Next with Linux Basic Kali Linux tools Command Syntax Patterns Linux Files and Directories Linux File System Searching User and Group Management Commands and Functions for the Beginner Using Linux Text Editors exercises Building Scripts Securing Your Linux Server GNU Utilities Control Privileged User AND MORE What are you waiting for Don t wait anymore press the buy now button and get started
