Mathematical Reviews ,2005 Artificial Intelligence in Real-time Control (AIRTC-2000) I. J. Ruda,J. K. Tar,2001 This Proceedings contains the papers presented at the 9th IFAC AIRTC 2000 Symposium on Artificial Intelligence in Real Time Control 2000 held at Budapest Polytechnic Hungary on 2 4 October AIRTC 2000 builds on the excellent reputation of previous meetings in the series for providing top quality papers in this important research field A positive development illustrated by this Proceedings is a new trend towards pragmatism in the research field Examples of this trend are an increase in the number of actual industrial applications support for more widespread use of new sophisticated technologies e g materials design further intertwining of artificial intelligence and control theory methods that reduces the reliance on blind faith still too often associated with AI methods Many things have changed since the first AIRTC event in 1988 Two examples illustrate the change in the general attitude of the IFAC family in 1990 one of the major closing presentations of the IFAC World Congress warned the control community about the coming hordes of AI people In 1999 one of the plenary papers at the IFAC World Congress pointed out that the AI based methods form a natural extension of control theory to the class of non linear systems with incomplete information at least as far as the optimisation is concerned This contrast in attitudes shows how during the past decade many AI people have embraced control theory and many control people have learned the basics of AI This Proceedings serves to continue this excellent dialogue by providing many quality papers which link both fields

Zheleznov,1966 Noncooperative Game Theory João P. Hespanha,2017-06-13 Noncooperative Game Theory is aimed at students interested in using game theory as a design methodology for solving problems in engineering and computer science Jo o Hespanha shows that such design challenges can be analyzed through game theoretical perspectives that help to pinpoint each problem s essence Who are the players What are their goals Will the solution to the game solve the original design problem Using the fundamentals of game theory Hespanha explores these issues and more The use of game theory in technology design is a recent development arising from the intrinsic limitations of classical optimization based designs In optimization one attempts to find values for parameters that minimize suitably defined criteria such as monetary cost energy consumption or heat generated However in most engineering applications there is always some uncertainty as to how the selected parameters will affect the final objective Through a sequential and easy to understand discussion Hespanha examines how to make sure that the selection leads to acceptable performance even in the presence of uncertainty the unforgiving variable that can wreck engineering designs Hespanha looks at such standard topics as zero sum non zero sum and dynamics games and includes a MATLAB guide to

coding Noncooperative Game Theory offers students a fresh way of approaching engineering and computer science applications An introduction to game theory applications for students of engineering and computer science Materials presented sequentially and in an easy to understand fashion Topics explore zero sum non zero sum and dynamics games MATLAB commands are included
