Fact: Many barium compounds are extremely poisonous, yet barium sulfate is routinely swallowed by patients in order to get clearer x-ray pictures of their lower intestines. Why doesn't barium sulfate poison these patients?

Fact: It is possible to saturate a swimming pool with silver bromide and kill off all the nasty little micro-organisms such as algae and bacteria, so that the pool water remains clean and sparkling, yet the water is as pure as drinking water and harmless to people. Since silver ion is a heavy metal ion and hence dangerous to our health in large doses, how is it possible that water saturated with silver bromide doesn't harm us?

The answers to the puzzling questions posed above lies in the low solubility of many salt compounds.

Introduction:

When ionic solids dissolve, they dissociate into their positive and negative ions that make up the solids. These ions become hydrates and have the same relative proportions when in solution and when solid. The more the solid dissolves, the more the ion concentration increases. This increase in ion concentration allows for the reverse reaction (crystallization) to occur. Eventually the rate of dissolving will equal the rate of crystallization. This state of saturation is called equilibrium. This state can be recognized by a constant color or constant mass.

Consider the solubility equilibrium of a saturated solution of AgCl:

AIChE Symposium Series American Institute of Chemical Engineers, 1986 **Lead Iodide X-ray and Gamma-ray Spectrometers for Room and High Temperature Operation**, 1997 In this study we report on the results of the investigation of lead iodide material properties The effectiveness of zone refining purification methods on the material purity is determined by ICP MS and ICP OES and correlated to the electrical and physical material properties We show that this

zone refining method is very efficient in removing impurities from lead iodide and we also determine the segregation coefficient for some of these impurities Triple axis x ray diffraction TAD analysis has been used to determine the crystalline perfection of the lead iodide after applying various cutting etching and fabrication methods The soft lead iodide crystal was found to be damaged when cleaved by a razor blade but by using a diamond wheel saw followed by etching the crystallinity of the material was improved as observed by TAD Low temperature photoluminescence also indicates an improvement in the material properties of the purified lead iodide Electrical properties of lead iodide such as carrier mobility were calculated based on carrier phonon scattering The results for the electrical properties were in good agreement with the experimental data
