The following chemical reaction is a **decomposition reaction**, which is a common way of representing a redox reaction with respect to water:

$$2\text{H}_2\text{O} \rightarrow 2\text{H}_2 + \text{O}_2$$
 The left representing the chemical change is a **decomposition reaction**, which is a common way of representing a redox reaction with respect to water. The right representing the chemical change is a **decomposition reaction**, which is a common way of representing a redox reaction with respect to water.

Abstract: The purpose of this study was to determine the effect of a 10-week training program on the physical fitness and health status of sedentary middle-aged men. The subjects were 20 men aged 40-50 years old, who had been sedentary for at least 10 years. They were divided into two groups: a control group and an experimental group. The experimental group underwent a supervised exercise program consisting of aerobic and strength training three times per week. Physical fitness was measured by maximum oxygen consumption ($\dot{V}O_{2\max}$), heart rate reserve (HRR), and body mass index (BMI). Health status was assessed by blood pressure (BP), cholesterol levels, and self-reported symptoms of fatigue and stress. After 10 weeks, the experimental group showed significant improvements in all measures compared to the control group.

...the ... of ...

The following flow diagram illustrates the process of the proposed algorithm. The process starts with the input of the initial population, which is then evaluated. The fitness of the population is calculated, and the best individual is selected. The population is then updated, and the process repeats until the termination condition is met.

Reaction of H_2O_2 with Fe^{2+} ions in acidic solution is an example of a redox reaction. In this reaction, H_2O_2 is oxidized to O_2 and Fe^{2+} is reduced to Fe^{3+} . The reaction is as follows:

$$\text{H}_2\text{O}_2 + 2\text{Fe}^{2+} + 2\text{H}^+ \rightarrow \text{O}_2 + 2\text{Fe}^{3+} + 2\text{H}_2\text{O}$$

The reaction is a redox reaction because the oxidation state of iron changes from +2 to +3, and the oxidation state of oxygen changes from -1 to 0.
