

INLET MODULE

Port **A** is connected externally to the pump outlet and internally to the inlets of the main valve sections **B1 - B4**. With the loader system at 'rest', ie with no load applied, the spool is held in the closed position by spring **C**.

Oil from the pump enters at **A** and is fed through the drilling in spool **D** to the end of the bore. Oil pressure therefore moves the spool against the force of the spring to connect port **A** to tank via port **E**. Therefore pressure in port **A** (and therefore at the main valve section inlets) equals the pressure created by the force of the spring.

When the system is under load, the pressure set up by spring **C** is supplemented by a load sensing signal **F**. (This signal will be the largest of the four load sensing signals from the main valve sections, see page 1 - 6.) In this condition the pressure in port **A** will equal the load sensing signal pressure plus the pressure created by the force of the spring.

Pressure Limiting

The load sensing signal is fed to one end of spool **G** in relief valve **H**. When the signal exceeds the setting of spring **J**, the spool moves in its bore to connect the load sensing signal to tank. Pressure is therefore limited by the setting of spring **J**.

Note: On 530B-HL machines only, this relief valve is rendered inoperative. See Technical Data in this supplement (Section 1, page 1 - 1).
