

# MICROBIAL GENETICS

## Chromosome:

The large DNA molecule of a microorganism cell that contains all the information/plans for the cell. A chromosome may contain tens of thousands of genes.

## Nucleotides Vs. Nucleosides:

DNA and RNA are and are made up of monomers known as nucleotides. When these monomers combine, the resulting chain is called a polynucleotide (poly- = "many").

- Each nucleotide is made up of three parts:
  - A nitrogen-containing ring structure called a nitrogenous base.
  - A five-carbon sugar
  - At least one phosphate group.

**Nucleosides:** as **nucleotides** without a **phosphate group**. A nucleoside consists simply of a **nitrogenous base** and a **5-carbon sugar** (either **ribose** or **deoxyribose**).

## **Microbial Genetics Question Model:**

**The Microbial Models of Molecular Biology** Rowland H. Davis, 2003-09-11 This book explains the role of simple biological model systems in the growth of molecular biology Essentially the whole history of molecular biology is presented here tracing the work in bacteriophages in E coli the role of other prokaryotic systems and also the protozoan and algal models Paramecium and Chlamydomonas primarily and the move into eukaryotes with the fungal systems Neurospora Aspergillus and yeast Each model was selected for its appropriateness for asking a given class of questions and each spawned its own community of investigators Some individuals made the transition to a new model over time and remnant communities of investigators continue to pursue questions in all these models as the cutting edge of molecular biological research flowed onward from model to model and onward into higher organisms and ultimately mouse and man
