Masticatory Muscles Activities in Temporomandibular Joint Internal Derangement
Chantal M. Lafrenière, 1995 Intramuscular EMG of the lateral pterygoid muscles surface EMG of the temporalis and masseter muscles electrogoniometry and force measurements of the TMJ were synchronously used to investigate the biomechanical role of the two portions of the lateral pterygoid muscle in relation to internal derangement ID of the temporomandibular joint TMJ This study dealt with the EMG analysis of five static conditions resting resisted protraction maximum voluntary contraction MVC in opening in molar and incisor clenching of TMJ ID and control subjects The analysis of variance results of the integrated linear envelop LE EMG showed no significant differences between the two groups The integrated LE EMG of the SLP was significantly lower in the TMJ group during molar clenching $104 \mu V$ pm 60 0 over $159 \mu V$ pm 68 8 for a $p = 0.020$ The SLP seemed to have lost its discal stabilizing function during clenching The integrated LE EMG signals of the ILP were significantly higher in the TMJ ID group during rest resisted protraction and incisor clenching $p = 0.029$ $p = 0.046$ $p = 0.031$ respectively The ILP muscle has probably adapted to control the inner joint instability while continuing its own actions The results of the isometric forces showed that TMJ ID subjects exhibited significantly lower molar bite forces $297.1 N$ over $419 N$ $p = 0.042$ confirming that they have less muscle strength and tissue tolerance than subjects with healthy masticatory muscle system Incisor bite forces however showed a tendency to be higher in the TMJ ID group $233 N$ over $180.5 N$ $p = 0.168$ possibly resulting from the training of a protracted bite and or hyperactivity of the ILP associated with ID Therefore a neuromuscular adaptation could be occurring in TMJ ID masticatory system affecting muscular actions and forces Abstract shortened by UMI
