Handbook of Computability and Complexity in Analysis Vasco Brattka, Peter Hertling, 2021-06-04 Computable analysis is the modern theory of computability and complexity in analysis that arose out of Turing's seminal work in the 1930s. This was motivated by questions such as which real numbers and real number functions are computable and which mathematical tasks in analysis can be solved by algorithmic means. Nowadays this theory has many different facets that embrace topics from computability theory, algorithmic randomness, computational complexity, dynamical systems, fractals, and analog computers up to logic, descriptive set theory, constructivism, and reverse mathematics. In recent decades, computable analysis has invaded many branches of analysis, and researchers have studied computability and complexity questions arising from real and complex analysis, functional analysis, and the theory of differential equations up to geometric measure theory and topology. This handbook represents the first coherent cross-section through most active research topics on the more theoretical side of the field. It contains 11 chapters grouped into parts on computability in analysis, complexity, dynamics, and randomness, and constructivity, logic, and descriptive complexity. All chapters are written by leading experts working at the cutting edge of the respective topic. Researchers and graduate students in the areas of theoretical computer science and mathematical logic will find systematic introductions into many branches of computable analysis and a wealth of information and references that will help them to navigate the modern research literature in this field.

Post-Quantum Cryptography Thomas

Johansson, Daniel Smith-Tone, 2023-08-09 This book constitutes the refereed proceedings of the 14th International Workshop on Post Quantum Cryptography PQCrypto 2022 held in College Park MD USA in August 14-18, 2023. The 25 full papers presented in this book were carefully reviewed and selected from 51 submissions. They are categorized in the following topical sections: code-based cryptography, group action-based cryptography, isogeny-based cryptography, lattice-based cryptography, multivariate cryptography, quantum algorithms, cryptanalysis, and models, post-quantum protocols, side-channel cryptanalysis, and countermeasures.

Advances in Bioinformatics and Computational Biology Ronnie Alves, 2018-10-23 This book constitutes the refereed proceedings of the 11th Brazilian Symposium on Bioinformatics BSB 2018 held in Rio de Janeiro, Brazil, in October-November 2018. The 13 revised full papers presented were carefully reviewed and selected from 26 submissions. The papers cover all aspects of bioinformatics and computational biology.

Machines, Computations, and Universality Jérôme Durand-Lose, Sergey Verlan, 2018-06-04 This book constitutes the refereed proceedings of the 8th International Conference on Machines, Computations, and Universality MCU 2018 held in Fontainebleau, France, in June 2018. The 9 revised full papers presented together with 5 invited talks were carefully reviewed and selected from numerous submissions. MCU explores computation in the setting of various discrete models: Turing machines, register machines, cellular automata, tile assembly systems, rewriting systems, molecular computing models, neural models, concurrent systems, etc., and analog and hybrid models: BSS machines, infinite time cellular automata, real machines, quantum computing, etc.
