### **Quaternary alluvial fan morphodynamics and basin sedimentation in North Iran** Christian Büdel, 2020-10-05

Availability of water and desiccation of important water reservoirs is a vital challenge in semi arid to arid climates with growing economy and population Low quantities of precipitation and high evaporation rates leave the water supply vulnerable to human activity and climatic variations Endorheic basins of Northern Iran were hydrologically landlocked within geological timescales and thus bear evidence of past variations of water resources in generations of water related landforms like abandoned lake level shorelines alluvial fans and stream terraces Understanding the development of these landforms reveals crucial information about past water reservoirs and landscape history This study offers a comprehensive approach on understanding the geomorphological development of the landscape throughout Late Pleistocene and Holocene times It integrates remote sensing and geographic information system analysis with geomorphological and stratigraphical mapping fieldwork and detailed sedimentological investigations The work shows the importance of analytical geomorphological mapping for delineating stratigraphic units of the Iranian Quaternary Thus several phases of drying and lake level retreat were identified in parallel geoarchives and could be dated to a time span from today to Late Pleistocene The findings link the fate of the citizens of the ancient city of Tepe Hissar to their access to water and to the power of geomorphological processes which started changing their environment

Insect Microbiome: From Diversity To Applications George Tsiamis,Brian Weiss,Adly M. M. Abdalla,2023-03-21 Insects are by far the most diverse and abundant animal group with respect to the number of species globally in ecological habitats and in biomass The ecological and evolutionary success of insects depends in part on their countless relationships with beneficial microorganisms which are known to influence all aspects of their physiology ecology and evolution These symbiotic associations are known to a enhance nutrient poor diets b aid digestion of recalcitrant food components c protect from predators parasites and pathogens d contribute to inter and intraspecific communication e affect efficiency as disease vectors and f govern mating and reproductive systems Characterization exploitation and management of the insect bacterial symbiotic associations can contribute significantly to the control of agricultural pests and disease vectors Insects that depend exclusively on nutritionally restricted diets such as plant sap vertebrate blood and woody material commonly possess obligate mutualistic endosymbionts involved in the provision of essential nutrients or in the degradation of food materials These intracellular mutualists commonly have the following biological features a they localize inside bacteriocytes b are essential for fitness c are maternally transmitted and d display strict host symbiont co evolutionary patterns In addition to obligate endosymbionts many insects harbor bacteria that are not essential for their survival or fecundity and are typically maintained with a patchy distribution in host populations Such symbionts can induce reproductive phenotypes in insect hosts including male killing feminization parthenogenesis or cytoplasmic incompatibility Because these bacteria manipulate their host s reproductive biology they also likely accelerate host processes As for essentially all animals microbial communities are particularly prominent in the digestive tract where they may be key mediators of the varied lifestyles of insect hosts The contribution of microorganisms particularly gut microorganisms to insect function is highly relevant from several perspectives linking to applications in medicine agriculture and ecology Gut associated microorganisms can include protists fungi archaea and bacteria but it is generally accepted that bacterial species dominate the microbial community in the guts of most insects Gut associated bacteria can influence a vectoring efficiency b developmental time c decomposition of plant biomass and carbon cycle d nitrogen fixation and nitrogen cycle e mating incompatibilities and f detoxification of pesticides leading to the acquisition of insecticide resistance

*Earth and Environmental Sciences* Imran Ahmad Dar,Mithas Ahmad Dar,2011-12-07 We are increasingly faced with environmental problems and required to make important decisions In many cases an understanding of one or more geologic processes is essential to finding the appropriate solution Earth and Environmental Sciences are by their very nature a dynamic field in which new issues continue to arise and old ones often evolve The

principal aim of this book is to present the reader with a broad overview of Earth and Environmental Sciences Hopefully this recent research will provide the reader with a useful foundation for discussing and evaluating specific environmental issues as well as for developing ideas for problem solving The book has been divided into nine sections Geology Geochemistry Seismology Hydrology Hydrogeology Mineralogy Soil Remote Sensing and Environmental Sciences **Water use efficiency of arable and grassland crops in legume-based intercropping systems** Annika Meißner,2021 Legume based intercropping systems have the potential for a more efficient use of water resources This depends on various factors such as environmental conditions and genotypic characteristics Therefore several genotypes of legumes and non legumes of arable grassland and woody crops were tested comparing intercropping and pure stands under both greenhouse and field conditions Greenhouse experiments with winter faba bean and winter wheat under water deficit revealed genotypic differences in the suitability for intercropping as well as effects on the microbial community Field experiments with direct and remote measurements showed that including legumes in arable and grassland low input systems improves water use efficiency and productivity in comparison to pure non legumes The grassland mixing partners perennial ryegrass and chicory had additional effects Furthermore arable intercropping reduced nitrous oxide emissions compared to fertilized wheat stands From the consolidated results some winter faba bean and white clover genotypes could be identified for further breeding for intercropping systems In summary intercropping with legumes improves the water use efficiency and the general performance and sustainability of the agro ecosystem **Wastewater Treatment and Reuse Technologies** Faisal Ibney Hai, Kazuo Yamamoto, Jega Veeriah Jegatheesan,2018-08-27 This book is a printed edition of the Special Issue Wastewater Treatment and Reuse Technologies that was published in Applied Sciences **New Zealand Journal of Agricultural Research** ,2013 Applied and Environmental Microbiology ,2007 **Proceedings of the International Symposium on Application of Precision Agriculture for Fruits and Vegetables** Leo Gene Albrigo,Reza Ehsani,2009 *Bio-based Solutions for Sustainable Development of Agriculture, Volume II* Eduardo V.
