Fundamentals of Airplane Flight Mechanics David G. Hull, 2007-01-20 Flight mechanics is the application of Newton's laws to the study of vehicle trajectories performance stability and aerodynamic control This text is concerned with the derivation of analytical solutions of airplane flight mechanics problems associated with flight in a vertical plane Algorithms are presented for calculating lift drag pitching moment and stability derivatives Flight mechanics is a discipline As such it has equations of motion acceptable approximations and solution techniques for the approximate equations of motion Once an analytical solution has been obtained numbers are calculated in order to compare the answer with the assumptions used to derive it and to acquaint students with the sizes of the numbers A subsonic business jet is used for these calculations

Mechanics of Flight Warren F. Phillips, 2004-01-29 This comprehensive volume addresses the mechanics of flight through a combination of theory and applications Topics are presented in a logical order and coverage within each is extensive including a detailed discussion on the quaternion formulation for six degree of freedom flight

Flight Mechanics Modeling and Analysis Jitendra R. Raol, Jatinder Singh, 2008-08-20 The design development analysis and evaluation of new aircraft technologies such as fly by wire unmanned aerial vehicles and micro air vehicles necessitate a better understanding of flight mechanics on the part of the aircraft systems analyst A text that provides unified coverage of aircraft flight mechanics and systems concept will go a long way

Aerodynamics, Aeronautics, and Flight Mechanics Barnes W. McCormick, 1994-09-28 A New Edition of the Most Effective Text Reference in the Field Aerodynamics Aeronautics and Flight Mechanics Second Edition Barnes W McCormick Pennsylvania State University 57506 2 When the first edition of Aerodynamics Aeronautics and Flight Mechanics was published it quickly became one of the most important teaching and reference tools in the field Not only did generations of students learn from it they continue to use it on the job the first edition remains one of the most well thumbed guides you'll find in an airplane company Now this classic text reference is available in a bold new edition All new material and the interweaving of the computer throughout make the Second Edition even more practical and current than before A New

Edition as Complete and Applied as the First Both analytical and applied in nature Aerodynamics Aeronautics and Flight Mechanics presents all necessary derivations to understand basic principles and then applies this material to specific examples You ll find complete coverage of the full range of topics from aerodynamics to propulsion to performance to stability and control Plus the new Second Edition boasts the same careful integration of concepts that was an acclaimed feature of the previous edition For example Chapters 9 10 and 11 give a fully integrated presentation of static dynamic and automatic stability and control These three chapters form the basis of a complete course on stability and control New Features You ll Find in the Second Edition A new chapter on helicopter and V STOL aircraft introduces a phase of aerodynamics not covered in most current texts Even more material than the previous edition including coverage of stealth airplanes and delta wings Extensive use of the computer throughout each chapter now contains several computer exercises A computer disk with programs written by the author is available

Introduction to Aircraft Flight Mechanics Thomas R. Yechout, 2003 Based on a 15 year successful approach to teaching aircraft flight mechanics at the US Air Force Academy this text explains the concepts and derivations of equations for aircraft flight mechanics It covers aircraft performance static stability aircraft dynamics stability and feedback control

Introduction to Aircraft Flight Mechanics, 2003 Flight mechanics and flight control for a multibody aircraft Köthe, Alexander, 2019-06-26 Aircraft operating as so called High Altitude Platform Systems HAPS have been considered as a complementary technology to satellites since several years These aircraft can be used for similar communication and monitoring tasks while operating at a fraction of the cost Such concepts have been successfully tested Those include the AeroVironment Helios and the Airbus Zephyr with an endurance of nearly 624 hours 26 days All these HAPS aircraft have a high aspect ratio wing using lightweight construction In gusty atmosphere this results in high bending moments and high structural loads which can lead to overloads Aircraft crashes for example from Google s Solara 50 or Facebook s Aquila give proof of that fact Especially in the troposphere where the active weather takes place gust loads occur which can lead to the destruction of the structure The Airbus Zephyr the only HAPS aircraft without flight accidents provides only a very small payload Thus it does not fully comply with the requirements for future HAPS aircraft To overcome the shortcomings of such single wing aircraft so called multibody aircraft are considered to be an alternative The concept assumes multiple aircraft connected to each other at their wingtips It goes back to the German engineer Dr Vogt In the United States shortly after the end of World War II he experimented with the coupling of manned aircraft This resulted in a high aspect ratio wing for the aircraft formation The range of the formation could be increased correspondingly The engineer Geoffrey S Sommer took up Vogt s idea and patented an aircraft configuration consisting of several unmanned aerial vehicles coupled at their wingtips However the patent does not provide any insight into the flight performance the flight mechanical modeling or the control of such an aircraft Single publications exist that deal with the performance of coupled aircraft A profound complete analysis however is missing so far This is where the present work starts

For the first time a flying vehicle based on the concept of the multibody aircraft will be analyzed in terms of flight mechanics and flight control. In a performance analysis the aircraft concept is analyzed in detail and the benefits in terms of bending moments and flight performance are clearly highlighted. Limits for operation in flight are shown considering aerodynamic optimal points. The joints at the wingtips allow a roll and pitch motion of the individual aircraft. This results in additional degrees of freedom for the design through the implementation of different relative pitch and bank angles. For example using individual pitch angles for individual aircraft further decreases the induced drag and increases flight performance. Because the lift is distributed symmetrically but not homogeneously along the wingspan a lateral trim of the individual aircraft in formation flight becomes necessary. The thesis presents a new method to implement this trim by moving the battery mass along half the wingspan which avoids additional parasite drag. Further a complete flight dynamics model is provided and analyzed for aircraft that are mechanically connected at their wingtips. To study this model in detail a hypothetical torsional and bending spring between the aircraft is introduced. If the spring constants are very high the flight dynamics model has properties similar to those of an elastic aircraft. Rigid body and formation eigenmotions can be clearly distinguished. If the spring constants are reduced towards zero which represents the case of the multibody aircraft classical flight mechanics eigenmotions and modes resulting from the additional degrees of freedom are coupled. This affects the eigenstructure of the aircraft. Hence normal motions with respect to the inertial space as known from a rigid aircraft cannot be observed anymore. The plant also reveals unstable behavior. Using the non linear flight dynamics model flight controllers are designed to stabilize the plant and provide the aircraft with an eigenstructure similar to conventional aircraft. Different controller design methods are used. The flight controller shall further maintain a determined shape of the flight formation, it shall control flight bank and pitch angles and it shall suppress disturbances. Flight control theories in the time domain, Eigenstructure assignment and in the frequency domain, H_∞ loop shaping are considered. The resulting inner control loops yield a multibody aircraft behavior that is similar to the one of a rigid aircraft. For the outer control loops classical autopilot concepts are applied. Overall the flight trajectory of the multibody aircraft above ground is controlled and thus an actual operation as HAPS is possible. In the last step the flight controller is successfully validated in non linear simulations with complete flight dynamics.

Flugzeuge in der Form von sogenannten H-Plattformen (engl. High Altitude Platform Systems, HAPS) werden seit einigen Jahren als kostengünstige Ergänzung zu teuren Satelliten betrachtet. Diese Flugzeuge können für ähnliche Kommunikations- und Überwachungsaufgaben eingesetzt werden. Zu den gegenwärtigen Konzepten solcher Fluggeräte, die bereits erfolgreich im Flugversuch eingesetzt wurden, zählen der Helios von AeroVironment und der Airbus Zephyr, der eine Flugdauer von fast 624 Stunden (26 Tagen) erreicht hat. Alle diese HAPS-Flugzeuge besitzen einen Flügel langer Streckung, der in Leichtbauweise konstruiert ist. Hieraus resultieren in großer Atmosphäre hohe Biegemomente und starke strukturelle Belastungen, die zu Überbelastungen führen können. Flugunfälle beispielsweise von Googles Solara 50 oder Facebooks Aquila

belegen dies Insbesondere in der Troposphäre in der das aktive Wetter stattfindet treten Belastungen auf die die Struktur zerstören können Der Airbus Zephyr der bisher als einziger HAPS Flugzeug frei von Flugunfällen ist besitzt nur eine sehr geringe Nutzlast Daher kann er die Anforderungen an zukünftige HAPS Flugzeuge nicht vollständig erfüllen Um die Schwachstellen solcher Einflügel Konzepte zu überwinden wird in dieser Arbeit ein alternatives Flugzeugkonzept betrachtet das als Mehrkörperflugzeug bezeichnet wird Das Konzept geht von mehreren an den Flügelspitzen miteinander verbundenen Flugzeugen aus und beruht auf Ideen des deutschen Ingenieurs Dr Vogt Dieser hatte in den USA kurz nach Ende des Zweiten Weltkrieges bemannte Flugzeuge aneinanderkoppeln lassen Hierdurch ergab sich ein Flugzeugverbund mit einem Flügel langer Streckung Damit konnte die Reichweite des Verbundes gesteigert werden Geoffrey S Sommer griff die Idee von Vogt auf und ließ sich eine Flugzeugkonfiguration patentieren die aus mehreren unbemannten Flugzeugen besteht die an den Enden der Tragflächen miteinander gekoppelt sind Die Patentschrift gibt jedoch keinen Einblick in die Flugleistungen die flugmechanische Modellierung oder die Regelung eines solchen Fluggerätes Vereinzelt existieren Veröffentlichungen die sich mit den Flugleistungen von gekoppelten Luftfahrzeugen beschäftigen Eine tiefgreifende vollständige flugmechanische Analyse fehlt jedoch bisher Hier setzt die vorliegende Arbeit an Ein Fluggerät basierend auf dem Konzept des Mehrkörperflugzeugs wird erstmalig hinsichtlich der Flugmechanik und Flugregelung untersucht In einer Flugleistungsbetrachtung wird das Flugzeugkonzept genau analysiert und die Vorteile hinsichtlich der Biegemomente und der Flugleistungen klar herausgestellt Die Grenzen des Einsatzes im Flugbetrieb werden mithilfe aerodynamischer Optimalpunkte aufgezeigt Hierbei die Lager an den Flügelspitzen die eine relative Roll und Nickbewegung der Flugzeuge untereinander ermöglichen ergeben sich durch die Einstellung unterschiedlicher Längslage und Höhenwinkel zur tatsächlichen Freiheitsgerade im Entwurf Die Verwendung unterschiedlicher Nicklagewinkel der einzelnen Flugzeuge reduziert beispielsweise den induzierten Widerstand weiter und steigert die Flugleistung Durch die symmetrische entlang der Spannweite jedoch nicht homogene Auftriebsverteilung ist auch eine laterale Trimmung der einzelnen Flugzeuge in der Formation notwendig Hier stellt die Arbeit eine neuartige Möglichkeit vor um diese Trimmung ohne zusätzlichen parasitären Widerstand mittels Verschiebung der Batteriemasse entlang der Halbspannweite umzusetzen Weiterhin wird ein vollständiges flugdynamisches Modell für mechanische Lager verbundene Luftfahrzeuge aufgestellt und analysiert Für diese Analyse wird eine hypothetische Torsions- und Biegefeder zwischen den Flugzeugen modelliert Sind die Federsteifigkeiten hinreichend hoch besitzt das flugdynamische Modell Eigenschaften die einem elastischen Flugzeug entsprechen Starrkörper und elastische Eigenbewegungsformen sind in diesem Fall klar separiert Bei immer weiterer Reduzierung bis auf eine Federsteifigkeit von Null kommt es zu Kopplungen zwischen den klassischen flugmechanischen Eigenbewegungsformen und den Moden aus den tatsächlichen Freiheitsgraden Dies stellt den Auslegungsfall für das Mehrkörperflugzeug dar Hierbei verändert sich die Eigenstruktur engl eigenstructure des Flugzeugs und normale bei einem starren Flugzeug beobachtbare Bewegungen gegenüber dem inertialen Raum sind nicht

mehr erkennbar Zusätzlich zeigt die Strecke instabiles Verhalten Basierend auf dem nichtlinearen flugdynamischen Modell werden mit verschiedenen Methoden Regler entworfen die die Regelstrecke stabilisieren und dem Flugzeug eine Streckenstruktur zuweisen die derjenigen klassischer Flugzeuge ähnelt Zudem soll durch die Regler eine vorgegebene Form des Flugzeugverbundes beibehalten werden die Fahrt der Längs- und Rolllagewinkel sollen geregelt und Störungen unterdrückt werden Als Auslegungsverfahren werden Theorien der Zustandsregelungen im Zeitbereich Eigenstrukturvorgabe und Frequenzbereich H-infinity loop shaping verwendet Hierdurch wird durch die inneren Regelschleifen ein Verhalten des Mehrkörperflugzeugs erzielt das dem eines starren Flugzeugs entspricht Für die äußeren Regelschleifen werden anschließend klassische Konzepte von Autopiloten verwendet Im Ergebnis ist eine Regelung des Flugweges über Grund des Mehrkörperflugzeugs und somit ein tatsächlicher Betrieb als HAPS möglich Die Funktionalität des Reglers wird abschließend in nichtlinearen Simulationen mit vollständiger Flugdynamik verifiziert

to study the motion of flying objects e.g. aircraft, missile through air. Provided by publisher *Computational Space Flight Mechanics* Claus Weiland, 2010-06-29. The mechanics of space flight is an old discipline. Its topic originally was the motion of planets, moons and other celestial bodies in gravitational fields. Kepler's 1571-1630 observations and measurements have led to probably the first mathematical description of planet's motion. Newton 1642-1727 gave then with the development of his principles of mechanics the physical explanation of these motions. Since then man has started in the second half of the 20th century to capture physically the Space in the sense that he did develop artificial celestial bodies which he brought into Earth's orbits like satellites or space stations or which he did send to planets or moons of our planetary system like probes or by which people were brought to the moon and back like capsules. Further he developed an advanced space transportation system: the U.S. Space Shuttle Orbiter which is the only winged space vehicle ever in operation. In the last two and a half decades there were several activities in the world in order to succeed the U.S. Orbiter like the HERMES project in Europe, the HOPE project in Japan, the X-33, X-34 and X-37 studies and demonstrators in the United States and the joint U.S./European project X-38. However, all these projects were cancelled. The motion of these vehicles can be described by Newton's equation of motion.
