Ite Trip Generation Handbook:

Trip Generation Handbook Kevin G. Hooper, Institute of Transportation Engineers, 2004 **Trip Generation Handbook** Kevin G. Hooper, 2017 Trip Generation Handbook Kevin G. Hooper, 2004-01-01 ITE's recommended practice on how to apply trip generation data *Improving Vehicle Trip Generation Estimations for Urban Contexts*, 2013 The purpose of this research is to develop and test a widely available ready to use method for adjusting the Institute of Transportation Engineers ITE Trip Generation Handbook vehicle trip generation estimates for urban context using regional household travel survey data The ITE Handbook has become the predominant method for estimating vehicle trips generated by different land uses or establishment providing a method for data collection and vehicle trip estimation based on the size of the development e.g gross square footage number of employees number of dwelling units These estimates are used in traffic impact analysis to assess the amount of impact the development will have on nearby transportation facilities and the corresponding charges for mitigating the development's negative impacts with roadway expansions added turning bays additional parking or traffic signalization for example The Handbook is often criticized however for its inability to account for variations in travel modes across urban contexts For more than fifty years ITE has collected suburban vehicle oriented data on trip generation for automobiles only Despite the provision of warnings against application in urban areas local governments continue to require the use of the ITE Handbook across all area types By over predicting vehicle traffic to developments in urban developments developments may be overcharged to mitigate these developments locating in urban environments despite the lower automobile mode shares discouraging infill development or densification When ITE's Trip Generation Handbook overestimates the vehicle impact of a development facilities are also overbuilt for the automobile traffic and diminishing the use of alternative modes When ITE's TGH underestimates this impact adjacent facilities may become oversaturated with traffic pushing cars onto smaller facilities nearby Currently there is momentum amongst practitioners to improve these estimation techniques in urban contexts to help support smart growth and better plan for multiple modes This research developed and tested a method to adjust ITE's Handbook vehicle trip generation estimates for changes in transportation mode shares in more urban contexts using information from household travel surveys Mode share adjustments provide direct reductions to ITE's Handbook vehicle trip estimations Household travel survey HTS data from three regions were collected Portland Oregon Seattle Washington and Baltimore Maryland These data were used to estimate the automobile mode share rates across urban context using three different adjustment methodologies A a descriptive table of mode shares across activity density ranges B a binary logistic regression that includes a built environment description of urban context with the best predictive power and C a binary logistic regression that includes a built environment description of urban context with high predictive power and land use policy sensitivity Each of these three methods for estimating the automobile mode share across urban context were estimated for each of nine land use categories resulting in nine descriptive tables Adjustment A

and eighteen regressions Adjustments B and C Additionally a linear regression was estimated to predict vehicle occupancy rates across urban contexts for each of nine land use categories 195 independently collected establishment level vehicle trip generation data were collected in accordance with the ITE Handbook to validate and compare the performance of the three adjustment methods and estimations from the Handbook Six land use categories out of the nine estimated were able to be tested Out of all of the land uses tested and verified ITE s Trip Generation Handbook appeared to have more accurate estimations for land uses that included residential condominiums townhouses LUC 230 supermarkets LUC 850 and quality sit down restaurants LUC 931 Moderate or small improvements were observed when applying urban context adjustments to mid rise apartments LUC 223 high turnover sit down restaurants LUC 932 The most substantial improvements occurred at high rise apartments LUC 222 and condominiums townhouses LUC 232 shopping centers LUC 820 or coffee donut LUC 936 or bread donut bagel shops LUC 939 without drive through windows The three methods proposed to estimate automobile mode share provides improvements to the Handbook rates for most infill developments in urban environments For the land uses analyzed it appeared a descriptive table of mode shares across activity density provided results with comparable improvements to the results from the more sophisticated binary logistic model estimations Additional independently collected establishment level data collections representing more land uses time periods and time of days are necessary to determine how ITE s Handbook performs in other circumstances including assessing the transferability of the vehicle trip end rates or mode share reductions across regions

Trip Generation Manual: User's guide and handbook, 2012 *Enhancing Internal Trip Capture Estimation for Mixed-use Developments* Brian S. Bochner, Kevin G. Hooper, Benjamin R. Sperry, Robert T. Dunphy, 2011 TRB s National Cooperative Highway Research Program NCHRP Report 684 *Enhancing Internal Trip Capture Estimation for Mixed Use Developments* explores an improved methodology to estimate how many internal trips will be generated in mixed use developments trips for which both the origin and destination are within the development The methodology estimates morning and afternoon peak period trips to and from six specific land use categories office retail restaurant residential cinema and hotel The research team analyzed existing data from prior surveys and collected new data at three mixed use development sites The resulting methodology is incorporated into a spreadsheet model which is available online for download

Incorporating the 10th Edition Institute of Traffic Engineers (ITE) Trip Generation Rates Into Virginia Department of Transportation Guidelines Kun Xie, 2021 The Institute of Transportation Engineers ITE released the Trip Generation TG 10th edition in 2017 which significantly updated its database and some of its trip generation rates were substantially lower than those of earlier editions This study aims to investigate the applicability of the TG 10th edition in various Virginia contexts and to recommend how to incorporate the TG 10th edition into state guidelines The research team surveyed 31 state transportation agencies to obtain a clear understanding of current practices in the adoption of trip rates and trip estimation approaches We systematically compared trip rates of TG 9th and 10th editions using

hypothesis tests and identified land uses with significant rate reduction Trip generation data were collected from 37 sites in Virginia during weekday PM peaks for the mixed use sites and single use sites with significantly reduced 10th edition rates multi family low rise and general office To investigate the use of trip rates in different settings general offices in both general urban suburban and dense multi use urban were considered For mixed use developments we explored the combinations of four internal trip capture models and TG rates of 9th and 10th editions to identify the best trip estimation approach Given that all trip data were collected after the outbreak of the COVID 19 pandemic Streetlight data were used to adjust trip counts to account for the impacts of COVID This study recommends that the VDOT Office of Land Use 1 accept the TG 10th edition for the development of a Traffic Impact Analysis TIA should the 8th or 9th edition rates show a TIA is required and select 10th edition trip rates according to settings and 2 accept the methodology presented in Trip Generation Handbook 3rd edition to estimate internal trip capture for mixed use developments This project will provide benefits to VDOT by improving the estimation of trip generation which is critical in determining charges to developers for transportation improvements and making decisions concerning the modification of existing facilities and the design of new facilities

Trip Generation: User's guide, 2003 Informational report of hundreds of land uses and transportation trip generation data *Trip Generation: Trip generation rates, plots and equations [cont'd]*, 2003 California Smart-growth Trip Generation Rates Study Susan Handy, Kevan R. Shafizadeh, Robert Schneider, 2013 **Truck Trip Generation Data** Michael J. Fischer, Myong Han, 2001 TRB's National Cooperative Highway Research Program NCHRP Synthesis 298 Truck Trip Generation Data identifies available data and assesses the current state of the practice in truck trip generation **Trip Generation**, 1997 The sixth edition of Trip generation includes several significant changes in format and content as compared to the fifth edition To facilitate use of the document the overall publication has been repackaged into three volumes Volumes 1 and 2 containing land use descriptions and data plots and a User's guide containing the general introductory instructional and appendix material A significant amount of new data has been collected since the publication of the fifth edition Data from more than 750 new studies have been added to the existing database for a combined total of more than 3 750 individual trip generation studies **Traditional Neighborhood Development Trip Generation Study**, 2005 *New Jersey Register*, 2012-11 Issues in Urban Trip Generation, 2017 In the 1976 the Institute of Transportation Engineers ITE compiled their first Handbook of guidelines and methods for evaluating development level transportation impacts specifically vehicular impacts Institute of Transportation Engineers 1976 Decades later these methods essentially the same as when they were originally conceived are used ubiquitously across the US and Canada Only recently with the guidelines in its third edition of the ITE's Trip Generation Handbook Institute of Transportation Engineers 2014 new data and approaches have been adopted despite substantial evidence that questions the accuracy of older data automobile bias and lack of sensitivity to urban contexts This dissertation contributes to this literature by focusing on the data methods and assumptions so commonly included in

development or site level evaluation of transportation impacts These methods are omnipresent in development level review used in transportation impact analyses or studies TIAs TISs of vehicular or mode based impacts vehicle miles traveled VMT and estimates of emissions scaling or scoping development size and evaluating transportation system development impact or utility fees or charges However few have evaluated the underlying characteristics of these foundational data with few exceptions this manuscript takes aim at understanding inherent issues in the collection and application of ITE s data and methods in various urban contexts This manuscript includes a compiled dissertation four papers written consecutively The first evaluates state of the art methods identifying gaps in the literature Two such gaps are explored A larger implicit assumption present in ITE s methods that the existing land use taxonomy is an optimal and accurate way to describe land use and segment data Results indicate a simplified taxonomy would provide substantial reductions in cost corresponding with a minor loss in the model s explanation of variance Following a common assumption that requires ITE s vehicle trips be converted into person trips and applied across contexts The results point to the need to consider demographics in site level transportation impact analysis particularly to estimate overall demand person trips transaction activity at retail and service development The findings from this research and previous studies are extrapolated to evaluate and quantify the potential bias when temporal special and social contexts are ignored The results indicate the compounding overestimation of automobile demand may inflate estimation by more than 100% in contexts where ITE should be applicable suburban areas with moderate incomes In the conclusions the implications of this work are explored followed by recommendations for practice and a discussion of the limitations of this research and future work
