**Part III** - Determine the name and list an identifying characteristic of each of the seven mystery metamorphic rock samples.

#### **Part I. Classification, Characteristics, and Identification of Metamorphic Rocks**

*What is Metamorphism?* Metamorphism is the changes in mineral composition and texture of a rock subjected to high temperature and pressure within the Earth. Metamorphism means to “change form”. Metamorphic rocks are produced from preexisting rocks – igneous, sedimentary, or metamorphic. The preexisting rock is called the parent rock.

*Classification of metamorphic rocks:* classify metamorphic rocks by texture and composition, as with the other rock types at which we have looked in lab.

#### *Metamorphic textures:*

- Texture is used to describe the size, shape, and arrangement of grains in a rock
- Two types of metamorphic textures are
  - 1) Foliated
    - In low-grade metamorphism, rocks tend to become more dense and compact
    - Under more extreme pressure, stress causes minerals to recrystallize or grow larger. The recrystallization can cause a realignment of mineral grains that results in a layered or banded appearance termed foliated texture.
    - Foliation describes the parallel alignment of minerals in a rock, or banding
  - 2) Nonfoliated.
    - Found in metamorphic rocks composed of one mineral that form equidimensional crystals; interlocking crystals
    - Does not show foliation or banding
