

## Lambda Expressions

## The world before Lambda

This is the same example rewritten as a standard anonymous inner class:

```
interface SumFunction {
    int sum(int a, int b);
}

SumFunction sumFunction = new SumFunction() {
    @Override
    public int sum(int a, int b) {
        return a + b;
    }
};

int result = sumFunction.sum(1, 3);
```

All functional interfaces implement exactly one method, which allows for syntactic sugar to implement that one method with much less code.

```

() -> expression | statement
param -> expression | statement
(params) -> expression | statement
(params) -> { expressions and statements }
{params} {params} -> { expressions and statements }

```

need to provide a container for a value that may or may not be present.

Optional is to handle the scenario where a method might return  
 a result.

<code>read</code>	Get "result" to "value" or get it from
<code>Optional.empty()</code>	<code>String result = optional.ofNullable( + obj).orElse("");</code>

<p><b>is a non-null value</b></p> <pre>optval = optval.ofNullable();</pre>	<p><b>Use Lambda Expressions</b></p> <pre>optval = obj -&gt; optval.of(() -&gt; {     if (obj != null) {         return obj;     }     return null; });</pre>
<p><b>is a potentially null value</b></p> <pre>optval = optval.orElse(null);</pre>	<p><b>Use the <code>orElse</code> method</b></p> <pre>optval = obj -&gt; optval.orElse(obj == null ? null : obj);</pre>

```
if ("optional" is null)
    opt := 0
else
    opt := 1
end if
```

 Lambda Expressions avoid statements to check if a rule

**Functional interfaces** are Java interfaces that contain exactly one abstract method. They serve as
