## the LAPMASTER works

*First the agitator tank (1) is filled with Lapmaster vehicle and compound of the proper proportion. Then the agitator switch (2) is turned on, starting the compound agitator motor. The compound valve switch (3) is turned to "on" position.*

*The timing clock (4) is set to the desired time cycle. This starts the lap plate (5) and automatically opens the compound valve (6), allowing compound to flow down the conductor track to the side of the conditioning ring (7) from which it is evenly distributed across the face of the lap by the rotation of the conditioning rings on the lap plate.*

*The conditioning rings rotating on the face of the lapping plate continually condition the lap surface during the entire lapping cycle.*

*At the end of the pre-determined lapping time, the clock automatically stops the lapping plate and closes the compound valve. Re-starting of the machine is accomplished by merely re-setting the timing clock.*

The Lapmaster principle, as demonstrated on this Model "12," is the same for all Lapmasters listed in this booklet.

The work being lapped causes wear on the lapping plate.

As the work is wearing the lap, the conditioning rings are continually conditioning the lapping surface.

The action of the conditioning rings is greater than the wear caused by the work being lapped.

The conditioning rings placed in balance on the lap generate a flat lap for flat work.
