Recombination during meiosis

Recombination is the exchange of DNA segments between non-sister chromatids of homologous chromosomes. This process occurs during Prophase I of Meiosis I. Recombination results in the formation of new genetic combinations, which are passed on to the daughter cells. Recombination is a key feature of meiosis, and it is responsible for the genetic diversity of the offspring. The process of recombination is illustrated in Figure 3, where the chromosomes of the parent cell are shown exchanging segments during Prophase I.
