Gleim,1998-07 **Mineralogy of the Caribou Massive Sulphide Deposit, Bathurst Area, New Brunswick** J. L. Jambor,1981 Stress corrosion cracking can potentially cause fuel failures at circumferential ridges in the sheath finite element computer codes elastres and feast are used to calculate two dimensional axisymmetric elastic plastic sheath stresses at and near the circumferential ridges the level of stresses is given by the fuel design such as pellet sheath diameters pellet length pellet density and by the operating conditions such as power history the accuracy convergence and cost of the stress calculations however are determined by the discretization used in the calculations the number of nodes in the finite element mesh the shape of the individual finite elements the pattern into which the finite elements are arranged and the size of the calculation steps into which the power history is subdivided in this study we determined the discretization that gives a reasonable compromise of accuracy convergence and cost for the stress calculations the highest accuracy is obtained by using triangular finite elements of aspect ratios close to one and assembling them into hexagonal patterns to capture the stress gradients five nodes are required across the sheath wall at the ridge but two nodes are sufficient near the midplane of the pellet the resulting mesh contains about 200 nodes and about 300 finite

elements calculation steps of 6 kw m provide a convergent solution with a factor of two margin against numerical divergence with the above arrangement least needs about 2 4 seconds on a cdc cyber 175 computer to calculate sheath stresses per calculation step six radial nodes at the ridge would double the computing cost decreasing the size of the calculation steps means more calculations are needed to analyze a given power history giving a linear increase in computing cost
