

# Mitosis

How do living things grow and repair themselves?

## Why?

Living things must grow and develop. At times they suffer injuries or damage, or cells simply wear out. New cells must be formed for the organism to survive. What process must occur to make a new, properly-functioning cell?

## Model 1 – Mitosis as Part of the Cell Cycle

1. Refer to Model 1. List the four phases in the mitosis process.

2. Where is mitosis in the cell cycle? Before G<sub>1</sub> and after G<sub>2</sub>.

3. What three phases of the cell cycle are considered interphase?

G<sub>1</sub> , Synthesis , G<sub>2</sub> .

4. Refer to the cell cycle shown.

**Optical Studies on Cell Division (Mitosis)** Norman Miyamoto Baker, 2010 Mitosis is the process by which cells after having duplicated their DNA content segregate chromosomes equally into two identical daughter cells Mitosis is a very short part of a normal cell cycle usually 24 hours and ranges from 30 minutes to an hour depending on cell type and environmental conditions During this incredibly short amount of time the cell undergoes several complex re arrangements biomechanically and biochemically Microtubules 20 nm width dimer polymers play an essential role as the building blocks that provides the cytoskeleton and mitotic spindle for the cell provide the force that segregates chromosomes anaphase to satisfaction of tension and attachment based checkpoints metaphase anaphase transition To elucidate the key role microtubules have in mitosis drugs such as taxol and nocodazole have been used to impart catastrophic global damage to the mitotic spindle and study the effects on cellular division However catastrophic global damage can not answer specific questions regarding highly spatially localized damage and temporally transient damage In elucidating the role of microtubules chromosomes and other key biological structures there is the need for a transient perturbation on the mitotic process To study the effects of transient perturbation on mitosis a Laser microscope system Robolase was developed to deliver spatially localized 0.4  $\mu$ m and temporally specific disruption inside living cells nanosurgery Specifically the affect of ablating chromosome tips mitotic spindles and chromatid are examined and the relationship between damaged sites and pathways controlling the progression of the cell cycle and DNA damage pathways are examined In conclusion an optically based method for studying mitosis with transient perturbation has been developed and used to determine that chromosome tip disruption affects cytokinetic progression prolonged disruption of mitotic spindle reveals force sensing in the metaphase spindle and double strand breaks of DNA recruit CENP A in addition to known DNA damage proteins
