

Limewater is a solution of calcium hydroxide, commonly used in the identification of carbon dioxide gas. Since calcium hydroxide is only sparingly soluble in water, technicians often make the solution by adding an excess of the solid calcium hydroxide to the required volume of deionised water, shaking the container and then leaving the mixture to settle. In this way, a saturated solution is produced but it can be of variable concentration.

Two students were each given a sample of limewater, from the same batch, in order to determine its concentration. Using 50.0 cm³ portions of the limewater, they carried out titrations using 0.100 mol dm⁻³ hydrochloric acid. One of the students obtained the following results:

Titration	Trial	1	2
Final Volume /cm ³	14.50	28.60	42.70
Initial Volume /cm ³	0.00	14.50	28.60
Volume Added /cm ³	14.50	14.10	14.10

The student decided that the mean titre was 14.10 cm³

The equation for the reaction is:

(a) (i) Calculate the number of moles of hydrochloric acid that reacted.

(1)

(ii) Calculate the number of moles of calcium hydroxide, Ca(OH)₂, that reacted with the acid.

(1)
