Physical Activity and Exercise among Children: Health Implications Åsa B. Tornberg, Lee

Barber, Ferdinand Von Walden, 2023-11-28 According to the World Health Organization's new recommendations on physical activity for children regardless of living with disability or not physical activity should be at least 60 minutes per day. Around the world, children are less and less physically active, leading to increased health risks. A healthy lifestyle as being physically active is normally set during childhood and adolescence, making children an important group to study and target. This Research Topic will address physiological health effects related to physical activity and exercise among children regardless of living with disability or not and how to assess these effects in a valid and reliable way. Children do not respond to physical activity and exercise in the same way as adults do due to unmaturing physiology. Living with a disability may also affect the child's response to physical activity and exercise. In order to be able to follow and prescribe physical activity and exercise to children, rigorous knowledge is needed on how children respond to different physical activity and exercise regimes. Additionally, to be able to follow and prescribe physical activity and exercise to children, valid and reliable assessment methods are needed. Not only do the tests need to be valid and reliable but also common standards on how to interpret them are required. This Frontiers Research Topic seeks a broad range of original research articles, systematic review articles, and meta-analyses in the area of physical activity and exercise among children, including physical activity assessments which are age- and ability-adjusted, fitness assessments which are age- and ability-adjusted, effects on health-related outcomes in relation to different physical activity interventions which are age- and ability-adapted, effects on health-related outcomes in relation to different exercise interventions which are age- and ability-adapted.

Optimal Physical Activity across the Lifespan for People of All Abilities Ronald F. Zernicke, David

Arthur Hart, Humans evolved to be mobile within the boundary conditions of Earth, and many biological and physiologic systems depend on mechanical loading to maintain integrity during growth and maturation, during skeletal maturity, and during the aging process. These systems subscribe to the use-it-or-lose-it principle and thus require continual use to maintain integrity. Given that premise, considerable basic and clinical research efforts have been directed at optimizing the effectiveness and positive impact of exercise on sports performance and the well-being of those with intact systems. However, those with disabilities or compromised abilities also benefit from exercise protocols, and there exists a need to focus attention on these populations as well. Given the myriad of biological and physiological systems that benefit from exercise and mechanical loading, there is a need for all humans of varying abilities to not only maintain the integrity of their health but to attempt to optimize it, recognizing that optimizing each person's health across the stages of the life cycle may require different exercise protocols dependent on stage of life, sex, genetics, and other individualized variables. For those with physical disabilities, embracing and maintaining such exercise protocols may be challenging, but expanded research, translation of findings, and integration of the outcomes into everyday life to enhance the health and well-being of this significant population
