Eaton-Rye, Roman Sobotka, 2017-08-08 Photosystem II is a 700 kDa membrane protein super complex responsible for the light driven splitting of water in oxygenic photosynthesis The photosystem is comprised of two 350 kDa complexes each made of 20 different polypeptides and over 80 co factors While there have been major advances in understanding the mature structure of this photosystem many key protein factors involved in the assembly of the complex do not appear in the holoenzyme The mechanism for assembling this super complex is a very active area of research with newly discovered assembly factors and subcomplexes requiring characterization Additionally the ability to split water is inseparable from light induced photodamage that arises from radicals and reactive O₂ species generated by Photosystem II chemistry Consequently to sustain water splitting a self repair cycle has evolved whereby damaged protein is removed and replaced so as to extend the working life of the complex Understanding how the biogenesis and repair processes are coordinated is among several important questions that remain to be answered Other questions include how and when are the inorganic cofactors inserted during the assembly and repair processes and how are the subcomplexes protected from photodamage during assembly Evidence has also been obtained for Photosystem II biogenesis centers in cyanobacteria but do these also exist in plants Do the molecular mechanisms associated with Photosystem II assembly shed fresh light on the assembly of other major energy transducing complexes such as Photosystem I or the cytochrome b₆ f complex or indeed other respiratory complexes The contributions to this Frontiers in Plant Science Research Topic are likely to reveal new details applicable to the assembly of a range of membrane protein complexes including aspects of self assembly and solar energy conversion that may be applied to artificial photosynthetic systems In addition a deeper understanding of Photosystem II assembly particularly in response to changing environmental conditions will provide new knowledge underpinning photosynthetic yields which may contribute to improved food production and long term food security *Structural aspects of peroxisome biogenesis and functions* Marek Skoneczny, Ralf Erdmann, Tânia Francisco, Christos Gatsogiannis, 2023-01-19 Proteomics, Multi-Omics and Systems Biology in Optic Nerve Regeneration Sanjoy K. Functional and Comparative Genomics of Saccharomyces and non-Saccharomyces Yeasts: Potential for Industrial and Food Biotechnology Isabel Sá-Correia,Ed Louis,2020-02-25

Since 1996 when the first *Saccharomyces cerevisiae* genome sequence was released a wealth of genomic data has been made available for numerous *S cerevisiae* strains its close relatives and non conventional yeast species isolates of diverse origins Several annotated genomes of interspecific hybrids both within the *Saccharomyces* clade and outside are now also available This genomic information together with functional genomics and genome engineering tools is providing a holistic assessment of the complex cellular responses to environmental challenges elucidating the processes underlying evolution speciation hybridization domestication and uncovering crucial aspects of yeasts physiological genomics to guide their biotechnological exploitation *S cerevisiae* has been used for millennia in the production of food and beverages and research over the last century and a half has generated a great deal of knowledge of this species Despite all this *S cerevisiae* is not the best for all uses and many non conventional yeast species have highly desirable traits that *S cerevisiae* does not have These include tolerance to different stresses e g acetic acid tolerance in *Zygosaccharomyces bailii* osmotolerance in *Z rouxii* and thermotolerance in *Kluyveromyces marxianus* and *Ogataea Hansenula polymorpha* the capacity of assimilation of diverse carbon sources e g high native capacity to metabolize xylose and potential for the valorization of agroforest residues by *Scheffersomyces Pichia stipites* as well as high protein secretion

fermentation efficiency and production of desirable flavors capacity to favor respiration over fermentation high lipid biosynthesis and accumulation and efficient production of chemicals other than ethanol amongst many Several non *Saccharomyces* species have already been developed as eukaryotic hosts and cell factories Others are highly relevant as food spoilers or for desirable flavor producers Therefore non conventional yeasts are now attracting increasing attention with their diversity and complexity being tackled by basic research for biotechnological applications The interest in the exploitation of non conventional yeasts is very high and a number of tools such as cloning vectors promoters terminators and efficient genome editing tools have been developed to facilitate their genetic engineering Functional and Comparative Genomics of non conventional yeasts is elucidating the evolution of genome functions and metabolic and ecological diversity relating their physiology to genomic features and opening the door to the application of metabolic engineering and synthetic biology to yeasts of biotechnological potential We are entering the era of the non conventional yeasts increasing the exploitation of yeast biodiversity and metabolic capabilities in science and industry In this collection the industrial properties of *S cerevisiae* in particular uses are explored along with its closely related species and interspecific hybrids This is followed by comparisons between *S cerevisiae* and non conventional yeasts in specific applications and then the properties of various non conventional yeasts and their hybrids
