contribution of 20–25 mW m<sup>-2</sup> can be expected. The effects of sediment deposition, compaction, pore water advection and radiogenic heat production have been combined in a numerical model (Hutchison 1985) to estimate the undisturbed basement heat flux. Although the sedimentation depresses the basement heat flux by 15–20%, this effect is more than compensated by radioactive heat production in the sediments so that the surface flux is estimated to be higher than that from the basement. The latter is calculated at about 33–39 mW m<sup>-2</sup> (0.8–0.9 H F U), a relatively low value. The overall uncertainty is about 20–25% and other estimates on continental margins with thick sediments (e.g. Reiter and Jessop 1985) probably have at least a similar uncertainty.
