

4 Finite Element Data Structures in Matlab

Here we discuss the data structures used in the finite element method and specifically those that are implemented in the example code. These are somewhat arbitrary in that one can imagine numerous ways to store the data for a finite element program, but we attempt to use structures that are the most flexible and conducive to Matlab. The design of these data structures may be depend on the programming language used, but usually are not significantly different than those outlined here.

4.1 Nodal Coordinate Matrix

Since we are programming the finite element method it is not unexpected that we need some way of representing the element discretization of the domain. To do so we define a set of nodes and a set of elements that connect these nodes in some way. The node coordinates are stored in the nodal coordinate matrix. This is simply a matrix of the nodal coordinates (imagine that). The dimension of this matrix is $n \times s$ where n is the number of nodes and s is the number of spatial dimensions of the problem. So, if we consider a nodal coordinate matrix `nodes` the y -coordinate of the n^{th} node is `nodes(n,2)`. Figure 1 shows a simple finite element discretization. For this simple mesh the nodal coordinate matrix would be as follows:

$$\text{nodes} = \begin{bmatrix} 0.0 & 0.0 \\ 2.0 & 0.0 \\ 0.0 & 3.0 \\ 2.0 & 3.0 \\ 0.0 & 6.0 \\ 2.0 & 6.0 \end{bmatrix}. \quad (1)$$

4.2 Element Connectivity Matrix

The element definitions are stored in the element connectivity matrix. This is a matrix of node numbers where each row of the matrix contains the connectivity of an element. So if we consider the connectivity matrix `elements` that describes a mesh of 4-node quadrilaterals the 36th element is defined by the connectivity vector `elements(36,:)` which for example may be [36 42 13 14] or that the elements connects nodes $36 \rightarrow 42 \rightarrow 13 \rightarrow 14$. Control in Automotive Systems Harald Waschl,Ilya Kolmanovsky,Maarten Steinbuch,Luigi del Re,2014-03-20 This book demonstrates the use of the optimization techniques that are becoming essential to meet the increasing stringency and variety of requirements for automotive systems It shows the reader how to move away from earlier approaches based on some degree of heuristics to the use of more and more common systematic methods Even systematic methods can be developed and applied in a large number of forms so the text collects contributions from across the theory methods and real world automotive applications of optimization Greater fuel economy significant reductions in permissible emissions new drivability requirements and the generally increasing complexity of automotive systems are among the criteria that the contributing authors set themselves to meet In many cases multiple and often conflicting requirements give rise to multi objective constrained optimization problems which are also considered Some of these problems fall into the domain of the traditional multi disciplinary optimization applied to system sub system or component design parameters and is performed

based on system models others require applications of optimization directly to experimental systems to determine either optimal calibration or the optimal control trajectory control law Optimization and Optimal Control in Automotive Systems reflects the state of the art in and promotes a comprehensive approach to optimization in automotive systems by addressing its different facets by discussing basic methods and showing practical approaches and specific applications of optimization to design and control problems for automotive systems The book will be of interest both to academic researchers either studying optimization or who have links with the automotive industry and to industrially based engineers and automotive designers
