Background Information

Genetic material is passed from parent to offspring. This material is called DNA. It is the instructions for building and running the body. It is also the instructions for making proteins. Proteins are the building blocks of the body. They are made of amino acids. The sequence of amino acids in a protein determines its shape and function. The shape and function of a protein determine its role in the body. For example, the protein hemoglobin carries oxygen from the lungs to the rest of the body. The protein insulin helps the body use sugar for energy. The protein collagen is a structural protein that helps build the body's framework.
