Mcquarrie Statistical Mechanics Solutions 21:

Structure and Dynamics of Solutions Hideyuki Ohtaki, H. Yamatera, 2013-10-22 Recent advances in the study of structural and dynamic properties of solutions have provided a molecular picture of solute solvent interactions. Although the study of thermodynamic as well as electronic properties of solutions have played a role in the development of research on the rate and mechanism of chemical reactions such macroscopic and microscopic properties are insufficient for a deeper understanding of fast chemical and biological reactions. In order to fill the gap between the two extremes it is necessary to know how molecules are arranged in solution and how they change their positions in both the short and long range. This book has been designed to meet these criteria. It is possible to develop a sound microscopic picture for reaction dynamics in solution without molecular level knowledge of how reacting ionic or neutral species are solvated and how rapidly the molecular environment is changing with time. A variety of actual examples is given as to how and when modern molecular approaches can be used to solve specific solution problems. The following tools are discussed: x ray and neutron diffraction, EXAFS and XANES, molecular dynamics and Monte Carlo computer simulations, Raman, infrared, NMR, fluorescence and photoelectron emission spectroscopic methods, conductance and viscosity measurements, high pressure techniques and statistical mechanics methods. Static and dynamic properties of ionic solvation, molecular solvation, ion pair formation, ligand exchange reactions and typical organic solvents are useful for bridging the gap between classical thermodynamic studies and modern single molecule studies in the gas phase. The book will be of interest to solution physical, inorganic, analytical and structural chemists as well as to chemical kineticists.

Thermodynamics of Solutions Eli Ruckenstein, Ivan L. Shulgin, 2009-06-17 This book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade. Even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book. First these papers are concerned with difficult or very nonideal systems, i.e. systems with very strong interactions, e.g. hydrogen bonding between components or systems with large differences in the partial molar volumes of the components, e.g. the aqueous solutions of proteins or systems that are far from normal conditions, e.g. critical or near critical mixtures. Second the conventional thermodynamic methods are not sufficient for the accurate treatment of these mixtures. Last but not least these systems are of interest for the pharmaceutical, biomedical and related industries. In order to meet the thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation theory of Kirkwood and Buff and ab initio quantum mechanical techniques. The Kirkwood-Buff theory is a rigorous formalism which is free of any of the approximations usually used in the thermodynamic treatment of multicomponent systems. This theory appears to be very fruitful when applied to the above mentioned difficult systems.
