Diane Stottlemeyer,2001-07-13 CD ROM contains Customizable templates test plans cases scripts and scenarios Links to resources and access to sample tools Specification Mining on the User Interface Level Fabian Richter,2020-10-20 Master s Thesis from the year 2012 in the subject Computer Science Software grade 1 0 Technical University of Darmstadt Secure Software Engineering Group language English abstract In this thesis we propose another approach targeted at web

applications that use Ajax HTML5 and other modern web technologies to achieve a look and feel that is only known by desktop applications. These web applications are also referred to as Rich Internet Application (RIA). The user interface is a part of an application the same way its business logic is. This requires software engineers to test the user interface to verify its correctness to the same extent they test the rest of the application. But testing graphical user interfaces is a tedious task without standardized testing technologies. Engineers use for business logic verification like unit testing. To address this shortcoming, research groups applied the concept of model based testing to user interface testing. In model based testing, an abstraction of the actual graphical user interface is used and test sequences are generated from the model. The model as a formal specification can also be checked by a model checker or pose as a test oracle to validate the correctness of the application. Ideally, such a model or specification can be generated or mined by an automated process. This process is usually referred to as specification mining and relieves the test engineer of the task to keep the specification up to date. Many tools and approaches have been proposed to target different kinds of applications and properties that the mining tool infers. At Europe's biggest software company SAP, where this thesis was manufactured, many RIAs are being developed based on a user interface library called SAPUI5. This library helps developers to create uniform looking RIAs. To test their graphical user interface and ensure quality software, our approach supports this testing process by using a web crawler known from search engines to automatically infer a specification or model from these interfaces. We achieved this by modifying the Ajax capable crawler Crawljax by A. Mesbah and using a new more efficient and modular state abstraction based on XPath expressions. Our CrawljaxXT also addresses many bugs and shortcomings of the original Crawljax and thus allows for reliable creation of complete user interface models without overly detailed state abstractions. Concluding, we successfully evaluated our mined models and its testing capabilities with a modified version of the free model based testing tool Graphwalker. Form Tester

Rahul Dixit, 2015. Whilst Model Based Testing (MBT) is an improvement over manual test specification, the leap from manual testing to MBT can be hard. Current MBT tools only allow development of models from scratch without reuse of existing manual test specifications. Conversely, current MBT tools do not facilitate partial automation of manual test cases, e.g. to automate only the test initialization procedure. Finally, existing MBT tools do not identify areas of the system that are not testable due to defects which may in turn conceal other defects. We propose a new MBT approach that addresses these shortcomings. The approach uses a form oriented model that clearly represents the actions, pages and fields of a web application. Instead of having to specify a test model from scratch, existing manual test cases can be used without modification as part of a test model specification. This means that developers can move from manual testing to MBT without any additional cost. Furthermore, the approach allows developers to use test models to partially automate manual tests. A test model can be used to automate the initialization step of manual test cases, hence making it easier to specify manual tests. Finally, the proposed approach can identify areas of the application that are unreachable due to defects using an online

testing strategy This provides an overview of all testable parts that have been covered as well as areas where additional defects may be concealed The approach was implemented in a novel MBT tool called FormTester and evaluated with real web applications One small and one mid sized application were tested using manually specified tests one large complex application was automated using the MBT tool The tool s performance gains over manual specification were evaluated Manual test cases were used to specify the model and their test initializations were generated automatically This improved time spent developing test cases Minutes Test by about 30% The same types and similar numbers of defects were discovered using the tool as manual specification indicating a similar effectiveness in defect detection
