

## Unit 9: Ecology

### Essential Skills

- 9-1. Be able to draw, label and give examples of an **energy pyramid** with 4 levels. (CCS: 6e-f)
- 9-2. Be able to explain the roles of **Photosynthesis** and **Respiration** in the **Carbon Cycle**, or the **Water Cycle**. (CCS: 6d)
- 9-3. Be able to explain and give an example of problems associated with either removing a species from an **ecosystem** or introducing a **non-native species** to an ecosystem. (CCS: 6a-b)

**Vocabulary** – You should be able to define and use the words in bold. (see website for a complete list)

### Study Guide

1. What is the difference between a **food chain** and a **food web**? Why is a food web a better depiction of an ecosystem?

A food chain shows the energy flow through a single feeding relationship. A food web shows the energy flow between all organisms in a community.

2. Draw and label an **energy pyramid** that contains 4 trophic levels. Include the terms **producer**, **primary consumer**, **secondary consumer**, **tertiary consumer**, **decomposer**, **autotroph**, **heterotroph**, **photosynthesis** & **cellular respiration**, **herbivore**, **carnivore/omnivore**, **detrivore**. Give an example of an organism that would be in each level.

3. Explain why producers and decomposers are the most important members of any ecosystem?  
Producers provide the energy (food) for all other trophic levels. Decomposers breakdown dead organisms and provide nutrients for the soil. Without nutrients, the producers could not survive.
4. Why is the maximum size of any energy pyramid 5 levels? How much energy can be passed from one **trophic level** to the next? Where does the rest of the energy go?  
The ecological rule of thumb states that only 10% of the energy is passed on to each trophic level. By the 5<sup>th</sup> level, there would only be 0.001% of the energy from the producers still available. There is just not enough energy to support another trophic level.
5. What is **primary productivity** for an ecosystem? How is it measured? If there are 10,000 grams of **biomass** available at the producer level of an ecosystem, how much biomass would you expect to measure in the secondary consumer level?  
Primary productivity is the rate at which producers build biomass. It is measured in grams of biomass (the amount of organic matter) over time. If there are 10,000 grams of biomass available at the producer level, you would expect there to be 1,000 grams available at the primary consumer level and 100 grams at the secondary consumer level.
6. Differentiate between the following ecology terms: **Biosphere**, **Ecosystem**, **Community**, **Population**, and **Organism**.  
Biosphere – the global system  
Ecosystem – all of the living & non-living things in a region  
Community – all of the living things in a region  
Population – all of the organisms of a single species in a region  
Organism – a single individual in a species
