Prediction of Stock Market Index Movements with Machine Learning Nazif AYYILDIZ, 2023-12-16 The book titled Prediction of Stock Market Index Movements with Machine Learning focuses on the performance of machine learning methods in forecasting the future movements of stock market indexes and identifying the most advantageous methods that can be used across different stock exchanges In this context applications have been conducted on both developed and emerging market stock exchanges The stock market indexes of developed countries such as NYSE 100 NIKKEI 225 FTSE 100 CAC 40 DAX 30 FTSE MIB TSX and the stock market indexes of emerging countries such as SSE BOVESPA RTS NIFTY 50 IDX IPC and BIST 100 were selected The movement directions of these stock market indexes were predicted using decision trees random forests k nearest neighbors naive Bayes logistic regression support vector machines and artificial neural networks methods Daily dataset from 01 01 2012 to 31 12 2021 along with technical indicators were used as input data for analysis According to the results obtained it was determined that artificial neural networks were the most effective method during the examined period Alongside artificial neural networks

logistic regression and support vector machines methods were found to predict the movement direction of all indexes with an accuracy of over 70%. Additionally, it was noted that while artificial neural networks were identified as the best method, they did not necessarily achieve the highest accuracy for all indexes. In this context, it was established that the performance of the examined methods varied among countries and indexes but did not differ based on the development levels of the countries. As a conclusion, artificial neural networks, logistic regression, and support vector machines methods are recommended as the most advantageous approaches for predicting stock market index movements.

Overcoming Data Scarcity in Earth Science Angela Gorgoglione, Alberto Castro Casales, Christian Chreties Ceriani, Lorena Etcheverry Venturini, 2020-05-22

heavily Environmental mathematical models represent one of the key aids for scientists to forecast, create, and evaluate complex scenarios. These models rely on the data collected by direct field observations. However, assembly of a functional and comprehensive dataset for any environmental variable is difficult, mainly because of i) the high cost of the monitoring campaigns and ii) the low reliability of measurements, e.g., due to occurrences of equipment malfunctions and/or issues related to equipment location. The lack of a sufficient amount of Earth science data may induce an inadequate representation of the response's complexity in any environmental system to any type of input change, both natural and human-induced. In such a case, before undertaking expensive studies to gather and analyze additional data, it is reasonable to first understand what enhancement in estimates of system performance would result if all the available data could be well exploited. Missing data imputation is an important task in cases where it is crucial to use all available data and not discard records with missing values. Different approaches are available to deal with missing data. Traditional statistical data completion methods are used in different domains to deal with single and multiple imputation problems. More recently, machine learning techniques such as clustering and classification have been proposed to complete missing data. This book showcases the body of knowledge that is aimed at improving the capacity to exploit the available data to better represent, understand, predict, and manage the behavior of environmental systems at all practical scales.
