Robust Control of a Precision Machine Tool Axis Michael Henry Smith, 1993 **Machine Tool Operation ...** Henry D. Burghardt, 1919 **Machine Tools for High Performance Machining** Norberto Lopez de Lacalle, Aitzol Lamikiz Mentxaka, 2008-10-01 Machine tools are the main production factor for many industrial applications in many important sectors Recent developments in new motion devices and numerical control have lead to considerable technological improvements in machine tools The use of five axis machining centers has also spread resulting in reductions in set up and lead times As a consequence feed rates cutting speed and chip section increased whilst accuracy and precision have improved as well Additionally new cutting tools have been developed combining tough substrates optimal geometries and wear resistant coatings Machine Tools for High Performance Machining describes in depth several aspects of machine structures machine elements and control and application The basics models and functions of each aspect are explained by experts from both academia and industry Postgraduates researchers and end users will all find this book an essential reference *Smooth Trajectory Generation and Precision Control of 5-axis CNC Machine Tools*, 2009 This thesis presents experimentally verified optimal feedrate generation and high performance precision control algorithms developed for 5 axis

machine tools A feedrate scheduling algorithm has been introduced to minimize the cycle time for 5 axis machining of curved tool paths The variation of the feed along the tool path is expressed in a cubic B spline form as a function of the arc displacement The velocity acceleration and jerk limits of the five axis drives are considered in finding the most optimal feed along the tool path to ensure smooth and linear operation of the servo drives with minimal tracking error Improvement in the productivity and linear operation of the drives are demonstrated through 5 axis experiments In an effort to design an accurate contour controller analytical models are developed to estimate the contour errors during simultaneous 5 axis machining Two types of contouring errors are defined by considering the normal deviation of tool tip from the reference path and the normal deviation of the tool axis orientation from the reference orientation trajectory A novel multi input multi output sliding mode controller is introduced to directly minimize the tool tip and tool orientation errors i e the contouring errors along the 5 axis tool paths The stability of the control scheme is proven analytically and the effectiveness of this new control strategy has been demonstrated experimentally An identification technique for identifying the closed loop transfer function of machine tool feed drives has been introduced The drive system is identified in closed loop including the feed drive mechanism motor amplifier and the control law A short Numerical Control Program is used for exciting the axis dynamics without interfering with the servo control loop A generalized drive model is utilized to capture the key dynamics of the drive systems while guaranteeing the stability of the identified model dynamics by solving a constrained opti
