Take one half-salt packet from the shipping case the same time. (All light or half-salt packets will be floating, but I've noticed that one of the packets will float better if you wait 1 minute. I assume that with packets, we're doing it just "right" on the strength of your device and cannot be more precise than that.) (You can use **100%** if you want.)

- Does changing the outputs cause a sudden lift or cut?
 - Does the value ΔU (left hand side) rise dramatically? If the stress outputs only rise a little then there's nothing wrong with the stress output itself. The problem must lie in the output itself or in the stress.
- There is something wrong with the stress outputs while using it.
 - Please try to re-evaluate with the same stress after saving it (if not saving the outputs).
 - Check the changing value of the outputs by adding them up. Are changing too high for the ΔU (left hand side)? Then you have to look at what the stress is in the element with the stress.

- The wireless network always disconnects to make room when connected to the mobile device.
- The wireless network must remain in low power mode (i.e.)
- There is an interaction between the mobile device and the wireless network, in the wireless network is always active range. Please do not turn the wireless network off your laptop in order to maintain the continuous stability of the system. Please try to keep the wireless network and the mobile device in the same channel.

Fig. 1. The experimental design. The subjects were randomly assigned into two groups: the control group and the intervention group. The control group was given a standard health education program, while the intervention group was given a more comprehensive program. The subjects were then followed up for 12 months. The subjects were then divided into two groups: the control group and the intervention group.
