Mini 3.5mm Stereo RCA Audio Switcher

Introduction

MC6 Mini is a 3.5mm A/DOUT / 3.5mm A/DOUT audio selector designed for customers who have several audio sources and outputs, a 3.5mm A/DOUT suitable for debugging equipment and all audio source controls, 3.5mm A/DOUT for power amplifier and active speakers control.

Adapting RDSM performance, can accurately control the volume without any noise. Each channel is fully isolated and with isolation status, no common ground noise will generated even connecting multiple audio sources.

Warning tips

1. After connection among MC6 Mini and your audio device, please choose correct operating mode: 3.5mm A/DOUT or 3.5mm A/DOUT via press the MODE button, or else the volume knob will not work normally.
2. When MC6 Mini is working in 3.5mm A/DOUT mode, if there is some noise from one peripheral of the A/DOUT, it is most likely caused by the design of the amplifier board. This is simply built noise, the low-frequency noise generated when the input of amplifier is connected to audio cable and not connected to audio signal. To solve this problem, it is necessary to connect an additional buffer preamp or isolation module between MC6 Mini and amplifier, the connection order is: MC6 Mini -> Buffer preamp / Audio isolation module -> power amplifier.
3. The mode of MC6 Mini cannot control phone signals from computers, but can control LINE OUT signals from computers.
4. All outputs cannot control headphones directly.

interest in the McGurk effect arises from a major general question in multisensory research How is information from different senses combined Despite decades of research a conclusive explanation for the illusion remains elusive This is a good demonstration of the challenges in the study of multisensory integration Speech is special in many ways It is the main means of human communication and a manifestation of a unique language system It is a signal with which all humans have a lot of experience We are exposed to it from birth and learn it through development in face to face contact with others It is a signal that we can both perceive and produce The role of the motor system in speech perception has been debated for a long time Despite very active current research it is still unclear to which extent and in which role the motor system is involved in speech perception Recent evidence shows that brain areas involved in speech production are activated during listening to speech and watching a talker s articulatory gestures Speaking involves coordination of articulatory movements and monitoring their auditory and somatosensory consequences How do auditory visual somatosensory and motor brain areas interact during speech perception How do these sensorimotor interactions contribute to speech perception It is surprising that despite a vast amount of research the secrets of speech perception have not yet been solved The multisensory and sensorimotor approaches provide new opportunities in solving them Contributions to the research topic are encouraged for a wide spectrum of research on speech perception in multisensory and sensorimotor contexts including novel experimental findings ranging from psychophysics to brain imaging theories and models reviews and opinions **Training Manual**
