

Ring Algorithm

- Applicable to systems organized as a ring (logically or physically)
- Assumes that the links are unidirectional, and that processes send their messages to their right neighbors
- Each process maintains an active list, consisting of all the priority numbers of all active processes in the system when the algorithm ends
- If process P_i detects a coordinator failure, it creates a new active list that is initially empty. It then sends a message $elect(i)$ to its right neighbor, and adds the number i to its active list
