Thermodynamics of Materials with Memory Giovambattista Amendola, Mauro Fabrizio, John Murrough Golden, 2021-10-20 This monograph deals with the mechanics and thermodynamics of materials with memory including properties of the dynamical equations that describe their evolution in time under varying loads A work in four parts the first is an introduction to continuum mechanics including classical fluid mechanics linear and non linear elasticity The second part considers continuum thermodynamics and its use to derive constitutive equations of materials with memory including viscoelastic solids fluids heat conductors and some examples of non simple materials In the third part free energies for materials with linear memory constitutive relations are discussed The concept of a minimal state is introduced Explicit formulae are presented for the minimum and related free energies The final part deals with existence uniqueness and stability results for the integrodifferential equations describing the dynamical evolution of viscoelastic materials including a new approach based on minimal states rather than histories There are also chapters on the controllability of thermoelastic systems with memory the Saint Venant problem for viscoelastic materials and on the theory of inverse problems The second edition includes a new chapter on thermoelectromagnetism as well as recent findings on minimal states and free energies It considers the case of minimum free energies for non simple materials and dielectrics together with an introduction to fractional derivative models
